All of our docker images are publicly available on Docker Hub and Quay. Our workflows use Docker Hub as the default Docker registry. Users can use Quay as the Docker registry by entering quay.io/cumulus/ for the workflow input "docker_registry", or enter a custom registry URL of their own choice.

If you use Cumulus in your research, please consider citing:

Li, B., Gould, J., Yang, Y. et al. Cumulus provides cloud-based data analysis for large-scale single-cell and single-nucleus RNA-seq. *Nat Methods* **17**, 793–798 (2020). https://doi.org/10.1038/s41592-020-0905-x

Contents 1

2 Contents

Version 1.0.0 September 23, 2020

- Add demultiplexing workflow for cell-hashing/nucleus-hashing/genetic-pooling analysis.
- Add support on CellRanger version 4.0.0.
- Update cumulus workflow with Pegasus version 1.0.0:
 - Use zarr file format to handle data, which has a better I/O performance in general.
 - Support focus analysis on Unimodal data, and appending other Unimodal data to it. (focus and append inputs in *cluster* step).
 - Quality-Control: Change percent_mito default from 10.0 to 20.0; by default remove bounds on UMIs (min_umis and max_umis inputs in *cluster* step).
 - Quality-Control: Automatically figure out name prefix of mitochondrial genes for GRCh38 and mm10 genome reference data.
 - Support signature / gene module score calculation. (calc_signature_scores input in cluster step)
 - Add Scanorama method to batch correction. (correction method input in cluster step).
 - Calculate UMAP embedding by default, instead of FIt-SNE.
 - Differential Expression (DE) analysis: remove inputs mwu and auc as they are calculated by default. And cell-type annotation uses MWU test result by default.
- Remove *cumulus_subcluster* workflow.

Version 0.15.0 May 6, 2020

- Update all workflows to OpenWDL version 1.0.
- Cumulus now supports multi-job execution from Terra data table input.
- Cumulus generates Cirrocumulus input in .cirro folder, instead of a huge .parquet file.

Version 0.14.0 February 28, 2020

- Added support for gene-count matrices generation using alternative tools (STARsolo, Optimus, Salmon alevin, Kallisto BUStools).
- Cumulus can process demultiplexed data with remapped singlets names and subset of singlets.
- Update VDJ related inputs in Cellranger workflow.
- SMART-Seq2 and Count workflows are in OpenWDL version 1.0.

Version 0.13.0 *February 7, 2020*

- Added support for aggregating scATAC-seq samples.
- Cumulus now accepts mtx format input.

Version 0.12.0 *December 14, 2019*

• Added support for building references for sc/snRNA-seq, scATAC-seq, single-cell immune profiling, and SMART-Seq2 data.

Version 0.11.0 *December 4, 2019*

• Reorganized Cumulus documentation.

Version 0.10.0 October 2, 2019

- scCloud is renamed to Cumulus.
- Cumulus can accept either a sample sheet or a single file.

Version 0.7.0 Feburary 14, 2019

- Added support for 10x genomics scATAC assays.
- scCloud runs FIt-SNE as default.

Version 0.6.0 January 31, 2019

- Added support for 10x genomics V3 chemistry.
- Added support for extracting feature matrix for Perturb-Seq data.
- Added R script to convert output_name.seurat.h5ad to Seurat object. Now the raw.data slot stores filtered raw counts.
- Added min_umis and max_umis to filter cells based on UMI counts.
- Added QC plots and improved filtration spreadsheet.
- Added support for plotting UMAP and FLE.
- Now users can upload their JSON file to annotate cell types.
- Improved documentation.
- Added lightGBM based marker detection.

Version 0.5.0 *November 18, 2018*

• Added support for plated-based SMART-Seq2 scRNA-Seq data.

Version 0.4.0 October 26, 2018

• Added CITE-Seq module for analyzing CITE-Seq data.

Version 0.3.0 October 24, 2018

• Added the demuxEM module for demultiplexing cell-hashing/nuclei-hashing data.

Version 0.2.0 October 19, 2018

 $\bullet \ \ Added \ support \ for \ V(D) J \ and \ CITE-Seq/cell-hashing/nuclei-hashing.$

Version 0.1.0 July 27, 2018

• KCO tools released!

14.1 First Time Running

14.1.1 Authenticate with Google

If you've done this before you can skip this step - you only need to do this once.

1. Ensure the Google Cloud SDK is installed on your computer.

Note: Broad users do not have to install this-they can type:

```
reuse Google-Cloud-SDK
```

to make the Google Cloud tools available.

2. Execute the following command to login to Google Cloud.:

```
gcloud auth login
```

- 3. Copy and paste the link in your unix terminal into your web browser.
- 4. Enter authorization code in unix terminal.

14.1.2 Create a Terra workspace

Create a new Terra workspace by clicking Create New Workspace in Terra
For more detailed instructions please see this document.

14.2 Latest and stable versions on Terra

Cumulus is a fast growing project. As a result, we frequently update WDL snapshot versions on Terra. See below for latest and stable WDL versions you can use.

14.2.1 Stable version - v1.0.0

WDL	Snapshot	Function
cumulus/cellranger_workflow 12		Run Cell Ranger tools, which include extracting sequence reads us-
		ing cellranger mkfastq or cellranger-atac mkfastq, generate count
		matrix using cellranger count or cellranger-atac count, run cell-
		ranger vdj or feature-barcode extraction
cumulus/count	14	Run alternative tools (STARsolo, Optimus, Salmon alevin, or
		Kallisto BUStools) to generate gene-count matrices from FASTQ
		files.
cumulus/demultiplexing	20	Run tools (demuxEM, souporcell, or demuxlet) for cell-
		hashing/nucleus-hashing/genetic-pooling analysis.
cumulus/cellranger_create_reference		Run Cell Ranger tools to build sc/snRNA-seq references.
cumulus/cellranger_atac_aggr	2	Run Cell Ranger tools to aggregate scATAC-seq samples.
cumulus/cellranger_atac_create_reference		Run Cell Ranger tools to build scATAC-seq references.
cumulus/cellranger_vdj_create_reference		Run Cell Ranger tools to build single-cell immune profiling refer-
		ences.
cumulus/smartseq2	7	Run HISAT2/STAR/Bowtie2-RSEM to generate gene-count matri-
		ces for SMART-Seq2 data from FASTQ files
cumulus/smartseq2_create_referen&e		Generate user-customized genome references for SMART-Seq2
		data.
cumulus/cumulus	31	Run cumulus analysis module for variable gene selection, batch cor-
		rection, PCA, diffusion map, clustering, visualization, differential
		expression analysis, cell type annotation, etc.
cumulus/cumulus_hashing_cite_s	seq0	Run cumulus for cell-hashing/nucleus-hashing/CITE-Seq analysis

14.2.2 Stable version - v0.15.0

WDL	Snapshot	Function	
cumulus/cellranger_workflow 10		Run Cell Ranger tools, which include extracting sequence reads us-	
		ing cellranger mkfastq or cellranger-atac mkfastq, generate count	
		matrix using cellranger count or cellranger-atac count, run cell-	
		ranger vdj or feature-barcode extraction	
cumulus/count	14	Run alternative tools (STARsolo, Optimus, Salmon alevin, or	
		Kallisto BUStools) to generate gene-count matrices from FASTQ	
		files.	
cumulus/cellranger_create_refere	næ	Run Cell Ranger tools to build sc/snRNA-seq references.	
cumulus/cellranger_atac_aggr	2	Run Cell Ranger tools to aggregate scATAC-seq samples.	
cumulus/cellranger_atac_create_r	eference	Run Cell Ranger tools to build scATAC-seq references.	
cumulus/cellranger_vdj_create_reference		Run Cell Ranger tools to build single-cell immune profiling refer-	
		ences.	
cumulus/smartseq2	7	Run HISAT2/STAR/Bowtie2-RSEM to generate gene-count matri-	
		ces for SMART-Seq2 data from FASTQ files	
cumulus/smartseq2_create_refere	n&e	Generate user-customized genome references for SMART-Seq2	
		data.	
cumulus/cumulus	24	Run cumulus analysis module for variable gene selection, batch cor-	
		rection, PCA, diffusion map, clustering, visualization, differential	
		expression analysis, cell type annotation, etc.	
cumulus/cumulus_subcluster	16	Run subcluster analysis using cumulus	
cumulus/cumulus_hashing_cite_s	eq0	Run cumulus for cell-hashing/nucleus-hashing/CITE-Seq analysis	

14.2.3 Stable version - v0.14.0

WDL	Snapshot	Function	
cumulus/cellranger_workflow 8		Run Cell Ranger tools, which include extracting sequence reads us-	
		ing cellranger mkfastq or cellranger-atac mkfastq, generate count	
		matrix using cellranger count or cellranger-atac count, run cell-	
		ranger vdj or feature-barcode extraction	
cumulus/count	11	Run alternative tools (STARsolo, Optimus, Salmon alevin, or	
		Kallisto BUStools) to generate gene-count matrices from FASTQ	
		files.	
cumulus/cellranger_create_refere	nce	Run Cell Ranger tools to build sc/snRNA-seq references.	
cumulus/cellranger_atac_aggr	1	Run Cell Ranger tools to aggregate scATAC-seq samples.	
cumulus/cellranger_atac_create_reference		Run Cell Ranger tools to build scATAC-seq references.	
cumulus/cellranger_vdj_create_refdrence		Run Cell Ranger tools to build single-cell immune profiling refer-	
		ences.	
cumulus/smartseq2	7	Run HISAT2/STAR/Bowtie2-RSEM to generate gene-count matri-	
		ces for SMART-Seq2 data from FASTQ files	
cumulus/smartseq2_create_referen&e		Generate user-customized genome references for SMART-Seq2	
		data.	
cumulus/cumulus	16	Run cumulus analysis module for variable gene selection, batch cor-	
		rection, PCA, diffusion map, clustering, visualization, differential	
		expression analysis, cell type annotation, etc.	
cumulus/cumulus_subcluster	10	Run subcluster analysis using cumulus	
cumulus/cumulus_hashing_cite_s	eo	Run cumulus for cell-hashing/nucleus-hashing/CITE-Seq analysis	

14.2.4 Stable version - v0.13.0

WDL	Snapshot	Function
cumulus/cellranger_workflow	7	Run Cell Ranger tools, which include extracting sequence reads us-
		ing cellranger mkfastq or cellranger-atac mkfastq, generate count
		matrix using cellranger count or cellranger-atac count, run cell-
		ranger vdj or feature-barcode extraction
cumulus/cellranger_create_refere	nde	Run Cell Ranger tools to build sc/snRNA-seq references.
cumulus/cellranger_atac_aggr	1	Run Cell Ranger tools to aggregate scATAC-seq samples.
cumulus/cellranger_atac_create_r	eference	Run Cell Ranger tools to build scATAC-seq references.
cumulus/cellranger_vdj_create_re	ference	Run Cell Ranger tools to build single-cell immune profiling refer-
		ences.
cumulus/smartseq2	5	Run Bowtie2 and RSEM to generate gene-count matrices for
		SMART-Seq2 data from FASTQ files
cumulus/smartseq2_create_reference		Generate user-customized genome references for SMART-Seq2
		data.
cumulus/cumulus	14	Run cumulus analysis module for variable gene selection, batch cor-
		rection, PCA, diffusion map, clustering, visualization, differential
		expression analysis, cell type annotation, etc.
cumulus/cumulus_subcluster	9	Run subcluster analysis using cumulus
cumulus/cumulus_hashing_cite_s	eq	Run cumulus for cell-hashing/nucleus-hashing/CITE-Seq analysis

14.2.5 Stable version - v0.12.0

WDL	Snapshot	Function	
cumulus/cellranger_workflow 6		Run Cell Ranger tools, which include extracting sequence reads us-	
		ing cellranger mkfastq or cellranger-atac mkfastq, generate count	
		matrix using cellranger count or cellranger-atac count, run cell-	
		ranger vdj or feature-barcode extraction	
cumulus/cellranger_create_refere	nde	Run Cell Ranger tools to build sc/snRNA-seq references.	
cumulus/cellranger_atac_create_1	eference	Run Cell Ranger tools to build scATAC-seq references.	
cumulus/cellranger_vdj_create_re	ference	Run Cell Ranger tools to build single-cell immune profiling refer-	
		ences.	
cumulus/smartseq2	5	Run Bowtie2 and RSEM to generate gene-count matrices for	
		SMART-Seq2 data from FASTQ files	
cumulus/smartseq2_create_reference		Generate user-customized genome references for SMART-Seq2	
		workflow.	
cumulus/cumulus	11	Run cumulus analysis module for variable gene selection, batch cor-	
		rection, PCA, diffusion map, clustering, visualization, differential	
		expression analysis, cell type annotation, etc.	
cumulus/cumulus_subcluster	8	Run subcluster analysis using cumulus	
cumulus/cumulus_hashing_cite_s	еф	Run cumulus for cell-hashing/nucleus-hashing/CITE-Seq analysis	

14.2.6 Stable version - v0.11.0

WDL	Snapshot	Function
cumulus/cellranger_workflow	4	Run Cell Ranger tools, which include extracting sequence reads us-
		ing cellranger mkfastq or cellranger-atac mkfastq, generate count
		matrix using cellranger count or cellranger-atac count, run cell-
		ranger vdj or feature-barcode extraction
cumulus/smartseq2	3	Run Bowtie2 and RSEM to generate gene-count matrices for
		SMART-Seq2 data from FASTQ files
cumulus/cumulus	8	Run cumulus analysis module for variable gene selection, batch cor-
		rection, PCA, diffusion map, clustering, visualization, differential
		expression analysis, cell type annotation, etc.
cumulus/cumulus_subcluster	5	Run subcluster analysis using cumulus
cumulus/cumulus_hashing_cite_s	seq	Run cumulus for cell-hashing/nucleus-hashing/CITE-Seq analysis

14.2.7 Stable version - v0.10.0

WDL	Snapshot	Function
cumulus/cellranger_workflow	3	Run Cell Ranger tools, which include extracting sequence reads us-
		ing cellranger mkfastq or cellranger-atac mkfastq, generate count
		matrix using cellranger count or cellranger-atac count, run cell-
		ranger vdj or feature-barcode extraction
cumulus/smartseq2	3	Run Bowtie2 and RSEM to generate gene-count matrices for
		SMART-Seq2 data from FASTQ files
cumulus/cumulus	7	Run cumulus analysis module for variable gene selection, batch cor-
		rection, PCA, diffusion map, clustering, visualization, differential
		expression analysis, cell type annotation, etc.
cumulus/cumulus_subcluster	4	Run subcluster analysis using cumulus
cumulus/cumulus_hashing_cite_s	ed	Run cumulus for cell-hashing/nucleus-hashing/CITE-Seq analysis

14.2.8 Stable version - HTAPP v2

WDL	Snapshot	Function
regev/cellranger_mkfastq_count	45	Run Cell Ranger to extract FASTQ files and generate gene-count
		matrices for 10x genomics data
scCloud/smartseq2	5	Run Bowtie2 and RSEM to generate gene-count matrices for
		SMART-Seq2 data from FASTQ files
scCloud/scCloud	14	Run scCloud analysis module for variable gene selection, batch cor-
		rection, PCA, diffusion map, clustering and more
scCloud/scCloud_subcluster	9	Run subcluster analysis using scCloud
scCloud/scCloud_hashing_cite_se	eq9	Run scCloud for cell-hashing/nucleus-hashing/CITE-Seq analysis

14.2.9 Stable version - HTAPP v1

WDL	Snapshot	Function	
regev/cellranger_mkfastq_count	Run Cell Ranger to extract FASTQ files and generate gene-coun		
		matrices for 10x genomics data	
scCloud/scCloud 3		Run scCloud analysis module for variable gene selection, batch cor-	
		rection, PCA, diffusion map, clustering and more	

14.3 Run Cell Ranger tools using cellranger workflow

cellranger_workflow wraps Cell Ranger to process single-cell/nucleus RNA-seq, single-cell ATAC-seq and single-cell immune profiling data, and supports feature barcoding (cell/nucleus hashing, CITE-seq, Perturb-seq). It also provide routines to build cellranger references.

14.3.1 A general step-by-step instruction

This section mainly considers jobs starting from BCL files. If your job starts with FASTQ files, and only need to run cellranger count part, please refer to this subsection.

1. Import cellranger_workflow

Import cellranger_workflow workflow to your workspace.

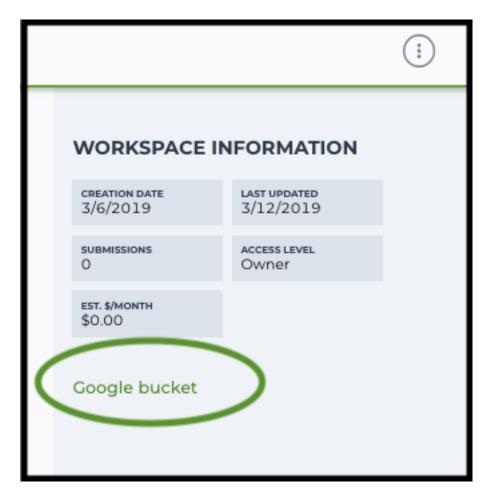

See the Terra documentation for adding a workflow. The *cellranger_workflow* workflow is under Broad Methods Repository with name "cumulus/cellranger_workflow".

Moreover, in the workflow page, click the Export to Workspace... button, and select the workspace to which you want to export *cellranger_workflow* workflow in the drop-down menu.

2. Upload sequencing data to Google bucket

Copy your sequencing output to your workspace bucket using gsutil (you already have it if you've installed Google cloud SDK) in your unix terminal.

You can obtain your bucket URL in the dashboard tab of your Terra workspace under the information panel.

Use gsutil cp [OPTION]... src_url dst_url to copy data to your workspace bucket. For example, the following command copies the directory at /foo/bar/nextseq/Data/VK18WBC6Z4 to a Google bucket:

Note: If input is a folder of BCL files, users do not need to upload the whole folder to the Google bucket. Instead, they only need to upload the following files:

```
RunInfo.xml
RTAComplete.txt
runParameters.xml
Data/Intensities/s.locs
Data/Intensities/BaseCalls
```

If data are generated using MiSeq or NextSeq, the location files are inside lane subfloders L001 under Data/Intensities/. In addition, if users' data only come from a subset of lanes (e.g. L001 and L002), users only need to upload lane subfolders from the subset (e.g. Data/Intensities/BaseCalls/L001, Data/Intensities/BaseCalls/L002 and Data/Intensities/L001, Data/Intensities/L002 if se-

Cumulus Documentation

quencer is MiSeq or NextSeq).

Alternatively, users can submit jobs through command line interface (CLI) using altocumulus, which will smartly upload BCL folders according to the above rules.

Note: Broad users need to be on an UGER node (not a login node) in order to use the -m flag

Request an UGER node:

```
reuse UGER qrsh -q interactive -l h_vmem=4g -pe smp 8 -binding linear:8 -P regevlab
```

The above command requests an interactive node with 4G memory per thread and 8 threads. Feel free to change the memory, thread, and project parameters.

Once you're connected to an UGER node, you can make gsutil available by running:

reuse Google-Cloud-SDK

3. Prepare a sample sheet

3.1 Sample sheet format:

Please note that the columns in the CSV can be in any order, but that the column names must match the recognized headings.

The sample sheet describes how to demultiplex flowcells and generate channel-specific count matrices. Note that *Sample*, *Lane*, and *Index* columns are defined exactly the same as in 10x's simple CSV layout file.

A brief description of the sample sheet format is listed below (**required column headers are shown in bold**).

Column	Description
Sample	Contains sample names. Each 10x channel should have a unique sample name.
Reference	
	Provides the reference genome used by Cell Ranger for each 10x channel. The elements in the <i>reference</i> column can be either Google bucket URLs to reference tarballs or keywords such as <i>GRCh38_v3.0.0</i> . A full list of available keywords is included in each of the following data type sections (e.g. sc/snRNA-seq) below.
Flowcell	
	Indicates the Google bucket URLs of uploaded BCL folders. If starts with FASTQ files, this should be Google bucekt URLs of uploaded FASTQ folders. The FASTQ folders should contain one subfolder for each sample in the flowcell with the sample name as the subfolder name. Each subfolder contains FASTQ files for that sample.
Lane	
	Tells which lanes the sample was pooled into. Can be either single lane (e.g. 8) or a range (e.g. 7-8) or all (e.g. *).
Index	Sample index (e.g. SI-GA-A12).
Chemistry	Describes the 10x chemistry used for the sample. This column is optional.
DataType	
	Describes the data type of the sample — rna, vdj, adt, or crispr. rna refers to gene expression data (cellranger count), vdj refers to V(D)J data (cellranger vdj), adt refers to antibody tag data, which can be either CITE-Seq, cell-hashing, or nucleus-hashing, crispr refers to Perturb-seq guide tag data, atac refers to scATAC-Seq data (cellranger-atac count).
	This column is optional and the default data type is <i>rna</i> .
FeatureBarco	oderile
	Google bucket urls pointing to feature barcode files for <i>adt</i> and <i>crispr</i> data. Features can be either antibody for CITE-Seq, cell-hashing, nucleus-hashing or gRNA for Perburb-seq. This column is optional provided no <i>adt</i> or <i>crispr</i> data are in the sample sheet.
	I

The sample sheet supports sequencing the same 10x channels across multiple flowcells. If a sample is sequenced across multiple flowcells, simply list it in multiple rows, with one flowcell per row. In the following example, we have 4 samples sequenced in two flowcells.

Example:

```
Sample, Reference, Flowcell, Lane, Index, Chemistry, DataType, FeatureBarcodeFile sample_1, GRCh38_v3.0.0, gs://fc-e0000000-0000-0000-0000-000000000000/

$\times VK18WBC6Z4, 1=2, SI=GA=A8, threeprime, rna$ (continues on next page)
```

(continued from previous page)

3.2 Upload your sample sheet to the workspace bucket:

Example:

4. Launch analysis

In your workspace, open cellranger_workflow in WORKFLOWS tab. Select the desired snapshot version (e.g. latest). Select Run workflow with inputs defined by file paths as below

- Run workflow with inputs defined by file paths
- Run workflow(s) with inputs defined by data table

and click SAVE button. Select Use call caching and click INPUTS. Then fill in appropriate values in the Attribute column. Alternative, you can upload a JSON file to configure input by clicking Drag or click to upload json.

Once INPUTS are appropriated filled, click RUN ANALYSIS and then click LAUNCH.

5. Notice: run cellranger mkfastg if you are non Broad Institute users

Non Broad Institute users that wish to run cellranger mkfastq must create a custom docker image that contains bcl2fastq.

See bcl2fastq instructions.

6. Run cellranger count only

Sometimes, users might want to perform demultiplexing locally and only run the count part on the cloud. This section describes how to only run the count part via cellranger_workflow.

1. Copy your FASTQ files to the workspace using gsutil in your unix terminal.

You should upload folders of FASTQ files. The uploaded folder (for one flowcell) should contain one subfolder for each sample belong to the this flowcell. **In addition, the subfolder name and the sample name in your sample sheet MUST be the same.** Each subfolder contains FASTQ files for that sample.

Example:

- 2. Create a sample sheet following the similar structure as above, except the following differences:
 - Flowcell column should list Google bucket URLs of the FASTQ folders for flowcells.
 - Lane and Index columns are NOT required in this case.

Example:

3. Set optional input run_mkfastq to false.

14.3.2 Single-cell and single-nucleus RNA-seq

To process sc/snRNA-seq data, follow the specific instructions below.

Sample sheet

1. Reference column.

Pre-built scRNA-seq references are summarized below.

Keyword	Description			
GRCh38-2020-	Human GRCh38 (GENCODE v32/Ensembl 98)			
A				
mm10-2020-A	Mouse mm10 (GENCODE vM23/Ensembl 98)			
	mH0+man GRCh38 (GENCODE v32/Ensembl 98) and mouse mm10 (GEN-			
2020-A	CODE vM23/Ensembl 98)			
GRCh38_v3.0.0	Human GRCh38, cellranger reference 3.0.0, Ensembl v93 gene annotation			
hg19_v3.0.0	Human hg19, cellranger reference 3.0.0, Ensembl v87 gene annotation			
mm10_v3.0.0	Mouse mm10, cellranger reference 3.0.0, Ensembl v93 gene annotation			
GRCh38_and_m	mH0um3a1(GRCh38) and mouse (mm10), cellranger references 3.1.0, Ensembl			
	v93 gene annotations for both human and mouse			
hg19_and_mm10	\text{Y-MA} (hg19) and mouse (mm10), cellranger reference 3.0.0, Ensembl v93			
	gene annotations for both human and mouse			
GRCh38_v1.2.0	Human GRCh38, cellranger reference 1.2.0, Ensembl v84 gene annotation			
or GRCh38				
hg19_v1.2.0 or	Human hg19, cellranger reference 1.2.0, Ensembl v82 gene annotation			
hg19				
mm10_v1.2.0 or	Mouse mm10, cellranger reference 1.2.0, Ensembl v84 gene annotation			
mm10				
GRCh38_and_m	mHouwan2a0d mouse, built from GRCh38 and mm10 cellranger references, En-			
or	sembl v84 gene annotations are used			
GRCh38_and_m				
GRCh38_and_SA	RSGown2GRCh38 and SARS-COV-2 RNA genome, cellranger reference 3.0.0,			
	generated by Carly Ziegler. The SARS-COV-2 viral sequence and gtf			
	are as described in [Kim et al. Cell 2020] (https://github.com/hyeshik/			
	sars-cov-2-transcriptome, BetaCov/South Korea/KCDC03/2020 based on			
	NC_045512.2). The GTF was edited to include only CDS regions, and re-			
	gions were added to describe the 5' UTR ("SARSCoV2_5prime"), the 3'			
	UTR ("SARSCoV2_3prime"), and reads aligning to anywhere within the			
	Negative Strand("SARSCoV2_NegStrand"). Additionally, trailing A's at the			
	3' end of the virus were excluded from the SARSCoV2 fasta, as these were			
	found to drive spurious viral alignment in pre-COVID19 samples.			

Pre-built snRNA-seq references are summarized below.

Keyword	Description				
GRCh38_premrr	GRCh38_premrnaHv3n0x0, introns included, built from GRCh38 cellranger reference 3.0.0, En-				
	sembl v93 gene annotation, treating annotated transcripts as exons				
GRCh38_premrr	a Hath 2.10, introns included, built from GRCh38 cellranger reference 1.2.0, En-				
or	sembl v84 gene annotation, treating annotated transcripts as exons				
GRCh38_premri	a				
mm10_premrna_	vM20 se, introns included, built from mm10 cellranger reference 1.2.0, En-				
or	sembl v84 gene annotation, treating annotated transcripts as exons				
mm10_premrna	mm10_premrna				
GRCh38_premri	GRCh38_premrnaHandamandOmpressnrinaronls2included, built from GRCh38_premrna_v1.2.0				
or	and mm10_premrna_v1.2.0				
GRCh38_premri	a_and_mm10_premrna				
GRCh38_premri	aHamdarSARSGoVi2cluded, built from GRCh38_premrna_v3.0.0, and SARS-				
	COV-2 RNA genome. This reference was generated by Carly Ziegler.				
	The SARS-COV-2 RNA genome is from [Kim et al. Cell 2020]				
	(https://github.com/hyeshik/sars-cov-2-transcriptome, BetaCov/South Ko-				
	rea/KCDC03/2020 based on NC_045512.2). Please see the description of				
	GRCh38_and_SARSCoV2 above for details.				

2. Index column.

Put 10x single cell 3' sample index set names (e.g. SI-GA-A12) here.

3. Chemistry column.

According to cellranger count's documentation, chemistry can be

Chemistry	Explanation	
auto	autodetection (default). If the index read has extra bases besides cell barcode	
	and UMI, autodetection might fail. In this case, please specify the chemistry	
threeprime	Single Cell 3	
fiveprime	Single Cell 5	
SC3Pv1	Single Cell 3 v1	
SC3Pv2	Single Cell 3 v2	
SC3Pv3	Single Cell 3 v3. You should set cellranger version input parameter to >=	
	3.0.2	
SC5P-PE	Single Cell 5 paired-end (both R1 and R2 are used for alignment)	
SC5P-R2	Single Cell 5 R2-only (where only R2 is used for alignment)	

4. DataType column.

This column is optional with a default **rna**. If you want to put a value, put **rna** here.

5. FetureBarcodeFile column.

Leave it blank for scRNA-seq and snRNA-seq.

6. Example:

(continues on next page)

(continued from previous page)

```
sample_4,mm10_v3.0.0,gs://fc-e0000000-0000-0000-0000000000000000/VK18WBC6Z4,7-8,

Workflow output

See the table below for important sc/snRNA-seq outputs.

Name	Туре	Description	
output_fastqs_directory	Array[String]	A list of google bucket urls containing FASTQ files, one	
		url per flowcell.	
output_count_directory	Array[String]	A list of google bucket urls containing count matrices,	
		one url per sample.	
metrics_summaries	File	A excel spreadsheet containing QCs for each sample.	
output_web_summary	Array[File]	A list of htmls visualizing QCs for each sample (cell-	
		ranger count output).	
count_matrix	String	gs url for a template count_matrix.csv to run Cumulus.	

14.3.3 Feature barcoding assays (cell & nucleus hashing, CITE-seq and Perturb-seq)

cellranger_workflow can extract feature-barcode count matrices in CSV format for feature barcoding assays such as *cell and nucleus hashing*, *CITE-seq*, and *Perturb-seq*. For cell and nucleus hashing as well as CITE-seq, the feature refers to antibody. For Perturb-seq, the feature refers to guide RNA. Please follow the instructions below to configure cellranger workflow.

Prepare feature barcode files

Prepare a CSV file with the following format: feature_barcode,feature_name. See below for an example:

```
TTCCTGCCATTACTA, sample_1
CCGTACCTCATTGTT, sample_2
GGTAGATGTCCTCAG, sample_3
TGGTGTCATTCTTGA, sample_4
```

The above file describes a cell hashing application with 4 samples.

If cell hashing and CITE-seq data share a same sample index, you should concatenate hashing and CITE-seq barcodes together and add a third column indicating the feature type. See below for an example:

```
TTCCTGCCATTACTA, sample_1, hashing
CCGTACCTCATTGTT, sample_2, hashing
GGTAGATGTCCTCAG, sample_3, hashing
TGGTGTCATTCTTGA, sample_4, hashing
CTCATTGTAACTCCT, CD3, citeseq
GCGCAACTTGATGAT, CD8, citeseq
```

Then upload it to your google bucket:

Sample sheet

1. Reference column.

This column is not used for extracting feature-barcode count matrix. To be consistent, please put the reference for the associated scRNA-seq assay here.

2. Index column.

The ADT/HTO index can be either Illumina index primer sequence (e.g. ATTACTCG, also known as D701), or 10x single cell 3' sample index set names (e.g. SI-GA-A12).

Note 1: All ADT/HTO index sequences (including 10x's) should have the same length (8 bases). If one index sequence is shorter (e.g. ATCACG), pad it with P7 sequence (e.g. ATCACGAT).

Note 2: It is users' responsibility to avoid index collision between 10x genomics' RNA indexes (e.g. SI-GA-A8) and Illumina index sequences for used here (e.g. ATTACTCG).

Note 3: For NextSeq runs, please reverse complement the ADT/HTO index primer sequence (e.g. use reverse complement CGAGTAAT instead of ATTACTCG).

3. Chemistry column.

The following keywords are accepted for *Chemistry* column:

Chemistry	Explanation
SC3Pv3	Single Cell 3 v3 (default).
SC3Pv2	Single Cell 3 v2
fiveprime	Single Cell 5
SC5P-PE	Single Cell 5 paired-end (both R1 and R2 are used for alignment)
SC5P-R2	Single Cell 5 R2-only (where only R2 is used for alignment)

4. DataType column.

Put adt here if the assay is CITE-seq, cell or nucleus hashing. Put crispr here if Perturb-seq.

5. FetureBarcodeFile column.

Put Google Bucket URL of the feature barcode file here.

6. Example:

In the sample sheet above, despite the header row,

- First row describes the normal 3' RNA assay;
- Second row describes its associated antibody tag data, which can from either a CITE-seq, cell hashing, or nucleus hashing experiment.

Cumulus Documentation

- Third row describes another tag data, which is in 10x genomics' V3 chemistry. For tag and crispr data, it is important to explicitly state the chemistry (e.g. SC3Pv3).
- Last row describes one gRNA guide data for Perturb-seq (see crispr in DataType field).

Workflow input

For feature barcoding data, cellranger_workflow takes Illumina outputs as input and runs cellranger mkfastq and cumulus adt. Revalant workflow inputs are described below, with required inputs highlighted in bold.

Parameters used for feature count matrix extraction

If the chemistry is V2, 10x genomics v2 cell barcode white list will be used, a hamming distance of 1 is allowed for matching cell barcodes, and the UMI length is 10. If the chemistry is V3, 10x genomics v3 cell barcode white list will be used, a hamming distance of 0 is allowed for matching cell barcodes, and the UMI length is 12.

For Perturb-seq data, a small number of sgRNA protospace sequences will be sequenced ultra-deeply and we may have PCR chimeric reads. Therefore, we generate filtered feature count matrices as well in a data driven manner:

- 1. First, plot the histogram of UMIs with certain number of read counts. The number of UMIs with x supporting reads decreases when x increases. We start from x = 1, and a valley between two peaks is detected if we find count [x] < count [x + 1] < count [x + 2]. We filter out all UMIs with < x supporting reads since they are likely formed due to chimeric reads.
- 2. In addition, we also filter out barcode-feature-UMI combinations that have their read count ratio, which is defined as total reads supporting barcode-feature-UMI over total reads supporting barcode-UMI, no larger than min_read_ratio parameter set above.

Workflow outputs

See the table below for important outputs.

Name	Type	Description
output_fastqs_directory	Array[String]	A list of google bucket urls containing FASTQ files, one
		url per flowcell.
output_count_directory	Array[String]	A list of google bucket urls containing feature-barcode
		count matrices, one url per sample.
count_matrix	String	gs url for a template count_matrix.csv to run cumulus.

In addition, For each antibody tag or crispr tag sample, a folder with the sample ID is generated under output_directory. In the folder, two files — sample_id.csv and sample_id.stat.csv.gz — are generated.

sample_id.csv is the feature count matrix. It has the following format. The first line describes the column names: Antibody/CRISPR, cell_barcode_1, cell_barcode_2, ..., cell_barcode_n. The following lines describe UMI counts for each feature barcode, with the following format: feature_name, umi_count_1, umi_count_2, ..., umi_count_n.

sample_id.stat.csv.gz stores the gzipped sufficient statistics. It has the following format. The first line describes the column names: Barcode, UMI, Feature, Count. The following lines describe the read counts for every barcode-umi-feature combination.

If the feature barcode file has a third column, there will be two files for each feature type in the third column. For example, if hashing presents, sample_id.hashing.csv and sample_id.hashing.stat.csv.gz will be generated.

If data type is crispr, three additional files, sample_id.umi_count.pdf, sample_id.filt.csv and sample_id.filt.stat.csv.gz, are generated.

sample_id.umi_count.pdf plots number of UMIs against UMI with certain number of reads and colors UMIs with high likelihood of being chimeric in blue and other UMIs in red. This plot is generated purely based on number of reads each UMI has.

sample_id.filt.csv is the filtered feature count matrix. It has the same format as sample_id.csv.

sample_id.filt.stat.csv.gz is the filtered sufficient statistics. It has the same format as sample_id.stat.csv.gz.

14.3.4 Single-cell ATAC-seq

To process scATAC-seq data, follow the specific instructions below.

Sample sheet

1. Reference column.

Pre-built scATAC-seq references are summarized below.

Keyword	Description	
GRCh38_atac_v1	.2.10 man GRCh38, cellranger-atac reference 1.2.0	
mm10_atac_v1.2	Mouse mm10, cellranger-atac reference 1.2.0	
hg19_atac_v1.2.0	Human hg19, cellranger-atac reference 1.2.0	
b37_atac_v1.2.0	Human b37 build, cellranger-atac reference 1.2.0	
GRCh38_and_m	mH0 <u>ir</u> atac <u>G</u> RC2.88 and mouse mm10, cellranger-atac reference 1.2.0	
hg19_and_mm10	atacnant 2209 and mouse mm10, cellranger-atac reference 1.2.0	
GRCh38_atac_v1	.140 man GRCh38, cellranger-atac reference 1.1.0	
mm10_atac_v1.1	Mouse mm10, cellranger-atac reference 1.1.0	
hg19_atac_v1.1.0	Human hg19, cellranger-atac reference 1.1.0	
b37_atac_v1.1.0	Human b37 build, cellranger-atac reference 1.1.0	
GRCh38_and_mmH0_ratacGRCh38 and mouse mm10, cellranger-atac reference 1.1.0		
hg19_and_mm10	alacnan Hg09 and mouse mm10, cellranger-atac reference 1.1.0	

2. Index column.

Put 10x single cell ATAC sample index set names (e.g. SI-NA-B1) here.

3. Chemistry column.

This column is not used for scATAC-seq data. Put **auto** here as a placeholder if you decide to include the Chemistry column.

4. DataType column.

Set it to atac.

5. FetureBarcodeFile column.

Leave it blank for scATAC-seq.

6. Example:

Workflow input

cellranger_workflow takes Illumina outputs as input and runs cellranger-atac mkfastq and cellranger-atac count. Please see the description of inputs below. Note that required inputs are shown in bold.

3. Check out the output in $output_directory/aggr_id$ folder, where $output_directory$ and $aggr_id$ are the inputs you set in Step 2.

14.3.5 Single-cell immune profiling

To process single-cell immune profiling (scIR-seq) data, follow the specific instructions below.

Sample sheet

1. Reference column.

Pre-built scIR-seq references are summarized below.

Keyword	Description		
GRCh38_vdj_v4	GRCh38_vdj_v4.0.Human GRCh38 V(D)J sequences, cellranger reference 4.0.0, annotation		
	built from Ensembl Homo_sapiens.GRCh38.94.chr_patch_hapl_scaff.gtf		
GRCm38_vdj_v4	.0M ouse GRCm38 V(D)J sequences, cellranger reference 4.0.0, annotation		
	built from Ensembl Mus_musculus.GRCm38.94.gtf		
GRCh38_vdj_v3	1.H uman GRCh38 V(D)J sequences, cellranger reference 3.1.0, annotation		
	built from Ensembl Homo_sapiens.GRCh38.94.chr_patch_hapl_scaff.gtf		
GRCm38_vdj_v3	.1MO ouse GRCm38 V(D)J sequences, cellranger reference 3.1.0, annotation		
	built from Ensembl Mus_musculus.GRCm38.94.gtf		
GRCh38_vdj_v2	OM uman GRCh38 V(D)J sequences, cellranger reference 2.0.0, annotation		
or GRCh38_vdj	built from Ensembl Homo_sapiens.GRCh38.87.chr_patch_hapl_scaff.gtf and		
	vdj_GRCh38_alts_ensembl_10x_genes-2.0.0.gtf		
GRCm38_vdj_v2.200 ouse GRCm38 V(D)J sequences, cellranger reference 2.2.0, annotation			
or	built from Ensembl Mus_musculus.GRCm38.90.chr_patch_hapl_scaff.gtf		
GRCm38_vdj			

2. Index column.

Put 10x single cell V(D)J sample index set names (e.g. SI-GA-A3) here.

3. Chemistry column.

This column is not used for scIR-seq data. Put **fiveprime** here as a placeholder if you decide to include the Chemistry column.

4. DataType column.

Set it to vdj.

5. FetureBarcodeFile column.

Leave it blank for scIR-seq.

6. Example:

```
Sample, Reference, Flowcell, Lane, Index, Chemistry, DataType sample_vdj, GRCh38_vdj_v3.1.0, gs://fc-e0000000-0000-0000-0000-00000-0000/
```

Workflow input

For scIR-seq data, cellranger_workflow takes Illumina outputs as input and runs cellranger mkfastq and cellranger vdj. Revalant workflow inputs are described below, with required inputs highlighted in bold.

Name	e Description	Example	Default
input	Sampfile Sheet (contains Sample, Ref-	"gs://fc-e0000000-0000-0000-0000-

Workflow output

See the table below for important scIR-seq outputs.

Name	Туре	Description
output_fastqs_directory	Array[String]	A list of google bucket urls containing FASTQ files, one
		url per flowcell.
output_vdj_directory	Array[String]	A list of google bucket urls containing vdj results, one
		url per sample.
metrics_summaries	File	A excel spreadsheet containing QCs for each sample.
output_web_summary	Array[File]	A list of htmls visualizing QCs for each sample (cell-
		ranger count output).
count_matrix	String	gs url for a template count_matrix.csv to run cumulus.

14.3.6 Build Cell Ranger References

We provide routines wrapping Cell Ranger tools to build references for sc/snRNA-seq, scATAC-seq and single-cell immune profiling data.

Build references for sc/snRNA-seq

We provide a wrapper of cellranger mkref to build sc/snRNA-seq references. Please follow the instructions below.

1. Import cellranger create reference

Import cellranger_create_reference workflow to your workspace.

See the Terra documentation for adding a workflow. The *cellranger_workflow* workflow is under Broad Methods Repository with name "cumulus/cellranger_create_reference".

Moreover, in the workflow page, click the Export to Workspace... button, and select the workspace to which you want to export *cellranger_create_reference* workflow in the drop-down menu.

2. Upload requred data to Google Bucket

Required data may include input sample sheet, genome FASTA files and gene annotation GTF files.

3. Input sample sheet

If multiple species are specified, a sample sheet in CSV format is required. We describe the sample sheet format below, with required columns highlighted in bold:

Column	Description
Genome	Genome name
Fasta	Location to the genome assembly in FASTA/FASTA.gz format
Genes	Location to the gene annotation file in GTF/GTF.gz format
Attributes	Optional, A list of key: value pairs separated by ;. If set, cellranger mkgtf
	will be called to filter the user-provided GTF file. See 10x filter with mkgtf for more
	details

Please note that the columns in the CSV can be in any order, but that the column names must match the recognized headings.

See below for an example for building Example:

```
Genome, Fasta, Genes, Attributes

GRCh38, gs://fc-e0000000-0000-0000-0000-000000000000/GRCh38.fa.gz,gs://fc-

→e0000000-0000-0000-0000-00000000000/GRCh38.gtf.gz,gene_biotype:protein_

→coding;gene_biotype:lincRNA;gene_biotype:antisense

mm10,gs://fc-e0000000-0000-0000-0000-00000000000/mm10.fa.gz,gs://fc-

→e0000000-0000-0000-0000-00000000000/mm10.gtf.gz
```

If multiple species are specified, the reference will built under **Genome** names concatenated by '_and_'s. In the above example, the reference is stored under 'GRCh38_and_mm10'.

4. Workflow input

Required inputs are highlighted in bold. Note that input_sample_sheet and input_fasta, input_gtf, genome and attributes are mutually exclusive.

NameDescription	Example	Default	
input_Asaapple_sheet in CSV format allows users to specify more than 1 genomes to build references (e.g.	"gs://fc-e0000000- 0000-0000-0000- 000000000000	csy"	
human and mouse). If a sample	000000000000/mput_sample_sneet	.csv	
sheet is provided, input_fasta, in-

5. Workflow output

Name	Туре	Description
output_refere	ndale	Gzipped reference folder with name <i>genome.tar.gz</i> . We will also store
		a copy of the gzipped tarball under output_directory specified in the
		input.

Build references for scATAC-seq

We provide a wrapper of cellranger-atac mkref to build scATAC-seq references. Please follow the instructions below.

1. Import cellranger_atac_create_reference

Import *cellranger_atac_create_reference* workflow to your workspace.

See the Terra documentation for adding a workflow. The *cellranger_workflow* workflow is under Broad Methods Repository with name "cumulus/cellranger_atac_create_reference".

Moreover, in the workflow page, click the Export to Workspace... button, and select the workspace to which you want to export *cellranger_atac_create_reference* workflow in the drop-down menu.

2. Upload required data to Google Bucket

Required data include config JSON file, genome FASTA file, gene annotation file (GTF or GFF3 format) and motif input file (JASPAR format).

3. Workflow input

Required inputs are highlighted in bold.

NameDescription	Example	Default
genon@enome reference name. New	refdata-cellranger-atac-mm10-	
reference will be stored in a folder	1.1.0	
named genome		
configCjsomguration file defined in 10x	"gs://fc-e0000000-0000-0000-	
genomics configuration file. Note	0000-000000000000/config.json"	
that links to files in the JSON must		
be Google bucket URLs		
outpuQuirectoryctory	"gs://fc-e0000000-

4. Workflow output

Name	Туре	Description
output_refere	nŒile	Gzipped reference folder with name <i>genome.tar.gz</i> . We will also store
		a copy of the gzipped tarball under output_directory specified in the
		input.

Build references for single-cell immune profiling data

We provide a wrapper of cellranger mkvdjref to build single-cell immune profiling references. Please follow the instructions below.

1. Import cellranger_vdj_create_reference

Import *cellranger_vdj_create_reference* workflow to your workspace.

See the Terra documentation for adding a workflow. The *cellranger_workflow* workflow is under Broad Methods Repository with name "cumulus/cellranger_vdj_create_reference".

Moreover, in the workflow page, click the Export to Workspace... button, and select the workspace to which you want to export *cellranger_vdj_create_reference* workflow in the drop-down menu.

2. Upload requred data to Google Bucket

Required data include genome FASTA file and gene annotation file (GTF format).

3. Workflow input

Required inputs are highlighted in bold.

NameDescription	Example	Default	
input Ifanta genome reference in either	"gs://fc-e0000000-		
FASTA or FASTA.gz format	0000-0000-0000-		
	000000000000/Homo_sapiens.GR	Ch38.dna.toplevel.fa.gz"	
input Igt fut gene annotation file in either	"gs://fc-e0000000-		
GTF or GTF.gz format	0000-0000-0000-		
	000000000000/Homo_sapiens.GR	Ch38.94.chr_patch_hapl_	scaff.gtf.gz"

		a copy of the gzipped tarball under output_directory specified in the
		input.

14.4 bcl2fastq

14.4.1 License

bcl2fastq license

14.4.2 Workflows

Workflows such as **cellranger_workflow** and **dropseq_workflow** provide the option of running bcl2fastq. We provide dockers containing bcl2fastq that are accessible only by members of the Broad Institute. Non-Broad Institute members will have to provide their own docker images. Please note that if you're a Broad Institute member and are not able to pull the docker image, please check https://app.terra.bio/#groups to see that you're a member of the all_broad_users group. If not, please contact Terra support and ask to be added to the all_broad_users@firecloud.org group.

14.4.3 **Docker**

Read this tutorial if you are new to Docker.

Then for a Debian based docker (e.g. continuumio/miniconda3), create the Dockerfile as follows:

```
RUN apt-get update && apt-get install --no-install-recommends -y alien unzip
ADD bcl2fastq2-v2-20-0-linux-x86-64.zip /software/
RUN unzip -d /software/ /software/bcl2fastq2-v2-20-0-linux-x86-64.zip && alien -i /

software/bcl2fastq2-v2.20.0.422-Linux-x86_64.rpm && rm /software/bcl2fastq2-v2*
```

Next, download bcl2fastq from the Illumina website, which requires registration. Choose the Linux rpm file format and download bcl2fastq2-v2-20-0-linux-x86-64.zip to the same directory as your Dockerfile.

You can host your private docker images in the Google Container Registry.

14.4.4 Example

In this example we create a docker image for running cellranger mkfastq version 3.0.2.

- 1. Create a GCP project or reuse an existing project.
- 2. Enable the Google Container Registry
- 3. Clone the cumulus repository:

```
git clone https://github.com/klarman-cell-observatory/cumulus.git
```

4. Add the lines to cumulus/docker/cellranger/3.0.2/Dockerfile to include bcl2fastq (see *Docker*).

14.4. bcl2fastg 61

- 5. Ensure you have Docker installed
- 6. Download cellranger from https://support.10xgenomics.com/single-cell-gene-expression/software/downloads/30
- 7. Build, tag, and push the docker. Remember to replace PROJECT_ID with your GCP project id:

```
cd cumulus/docker/cellranger/3.0.2/
docker build -t cellranger-3.0.2 .
docker tag cellranger-3.0.2 gcr.io/PROJECT_ID/cellranger:3.0.2
gcr.io/PROJECT_ID/cellranger:3.0.2
```

8. Import cellranger_workflow workflow to your workspace (see cellranger_workflow steps), and enter your docker registry URL (in this example, "gcr.io/PROJECT_ID/") in cellranger_mkfastq_docker_registry field of cellranger_workflow inputs.

14.5 Cell Ranger alternatives to generate gene-count matrices for 10X data

This count workflow generates gene-count matrices from 10X FASTQ data using alternative methods other than Cell Ranger.

14.5.1 Prepare input data and import workflow

1. Run cellranger_workflow to generate FASTQ data

You can skip this step if your data are already in FASTQ format.

Otherwise, you need to first run *cellranger_workflow* to generate FASTQ files from BCL raw data for each sample. Please follow cellranger_workflow manual.

Notice that you should set **run_mkfastq** to true to get FASTQ output. You can also set **run_count** to false if you want to skip Cell Ranger count, and only use the result from *count* workflow.

For Non-Broad users, you'll need to build your own docker for bcl2fastq step. Instructions are here.

2. Import count

Import count workflow to your workspace.

See the Terra documentation for adding a workflow. The *count* workflow is under Broad Methods Repository with name "cumulus/count".

Moreover, in the workflow page, click the Export to Workspace... button, and select the workspace to which you want to export *count* workflow in the drop-down menu.

3. Prepare a sample sheet

3.1 Sample sheet format:

The sample sheet for *count* workflow should be in TSV format, i.e. columns are seperated by tabs not commas. Please note that the columns in the TSV can be in any order, but that the column names must match the recognized headings.

The sample sheet describes how to identify flowcells and generate channel-specific count matrices.

A brief description of the sample sheet format is listed below (**required column headers are shown in bold**).

Column	Description
Sample	Contains sample names. Each 10x channel should have a unique sample name.
Flowcells	Indicates the Google bucket URLs of folder(s) holding FASTQ files of this sample.

The sample sheet supports sequencing the same 10x channel across multiple flowcells. If a sample is sequenced across multiple flowcells, simply list all of its flowcells in a comma-seperated way. In the following example, we have 2 samples sequenced in two flowcells.

Example:

Moreover, if one flowcell of a sample contains multiple FASTQ files for each read, i.e. sequences from multiple lanes, you should keep your sample sheet as the same, and *count* workflow will automatically merge lanes altogether for the sample before performing counting.

3.2 Upload your sample sheet to the workspace bucket:

Use gsutil (you already have it if you've installed Google cloud SDK) in your unix terminal to upload your sample sheet to workspace bucket.

Example:

4. Launch analysis

In your workspace, open count in WORKFLOWS tab. Select the desired snapshot version (e.g. latest). Select Process single workflow from files as below

- Run workflow with inputs defined by file paths
- Run workflow(s) with inputs defined by data table

and click SAVE button. Select Use call caching and click INPUTS. Then fill in appropriate values in the Attribute column. Alternative, you can upload a JSON file to configure input by clicking Drag or click to upload json.

Once INPUTS are appropriated filled, click RUN ANALYSIS and then click LAUNCH.

14.5.2 Workflow inputs

Below are inputs for *count* workflow. Notice that required inputs are in bold.

Name	Description	Example	Default
input_tsv_fil	eInput TSV sample sheet describing metadata of each sample.	"gs://fc-e0000000- 0000-0000-0000- 000000000000	et.tsv"
genome	Genome reference name. Current support: GRCh38, mm10.	"GRCh38"	
chemistry	10X genomics' chemistry name. Current support: "tenX_v3" (for V3 chemistry), "tenX_v2" (for V2 chemistry).	"tenX_v3"	
output_dire	ctory URL of output directory.	"gs://fc-e0000000- 0000-0000-0000- 000000000000	,,,
run_count	If you want to run count tools to generate gene-count matrices.	true	true
count_tool	Count tool to generate result. Options:	"StarSolo"	"StarSolo"
locker_regis	r Docker registry to use. Notice that docker image for Bustools is seperate. • "cumulusprod" for Docker Hub images;		"cumulusprod
	"quay.io/cumulus" for backup images on Red Hat registry.		
zones	Google cloud zones to consider for execution.	"us-east1-d us-west1-a us- west1-b"	"us- central1- a us- central1- b us- central1- c us- central1-f us-east1-b us-east1-d us-west1-a us-west1-b us-west1-
num_cpu	Number of CPUs to request for count per channel. Notice that when use Optimus for count, this input only affects steps of copying files. Optimus uses CPUs due to its own strategy.	32	32
disk_space	Disk space in GB needed for count per channel. Notice that when use Optimus for count, this input only affects steps of copying files. Optimus uses disk space	500	500
4.5. Cell R	anger alternatives to generate gene-count matrice	s for 10X data	65
memory	Memory size in GB needed for count per channel.	120	120

14.5.3 Workflow outputs

See the table below for *count* workflow outputs.

Name	Туре	Description
output_folder	String	Google Bucket URL of output directory. Within it, each
		folder is for one sample in the input sample sheet.

14.6 Extract gene-count matrices from plated-based SMART-Seq2 data

14.6.1 Run SMART-Seq2 Workflow

Follow the steps below to extract gene-count matrices from SMART-Seq2 data on Terra. This WDL aligns reads using STAR, HISAT2, or Bowtie 2 and estimates expression levels using RSEM.

1. Copy your sequencing output to your workspace bucket using gsutil in your unix terminal.

You can obtain your bucket URL in the dashboard tab of your Terra workspace under the information panel.

Note: Broad users need to be on an UGER node (not a login node) in order to use the -m flag

Request an UGER node:

```
reuse UGER qrsh -q interactive -l h_vmem=4g -pe smp 8 -binding linear:8 -P regevlab
```

The above command requests an interactive node with 4G memory per thread and 8 threads. Feel free to change the memory, thread, and project parameters.

Once you're connected to an UGER node, you can make gsutil available by running:

```
reuse Google-Cloud-SDK
```

Use gsutil cp [OPTION]... src_url dst_url to copy data to your workspace bucket. For example, the following command copies the directory at /foo/bar/nextseq/Data/VK18WBC6Z4 to a Google bucket:

-m means copy in parallel, -r means copy the directory recursively.

2. Create a sample sheet.

Please note that the columns in the CSV can be in any order, but that the column names must match the recognized headings.

The sample sheet provides metadata for each cell:

Column	Description
Cell	Cell name.
Plate	Plate name. Cells with the same plate name are from the same plate.
Read1	Location of the FASTQ file for read1 in the cloud (gsurl).
Read2	(Optional). Location of the FASTQ file for read2 in the cloud (gsurl). This field
	can be skipped for single-end reads.

Example:

3. Upload your sample sheet to the workspace bucket.

Example:

4. Import *smartseq2* workflow to your workspace.

See the Terra documentation for adding a workflow. The *smartseq2* workflow is under Broad Methods Repository with name "cumulus/smartseq2".

Moreover, in the workflow page, click Export to Workspace... button, and select the workspace to which you want to export *smartseq2* workflow in the drop-down menu.

- 5. In your workspace, open smartseq2 in WORKFLOWS tab. Select Run workflow with inputs defined by file paths as below
 - Run workflow with inputs defined by file paths
 - Run workflow(s) with inputs defined by data table

and click SAVE button.

Inputs:

Please see the description of inputs below. Note that required inputs are shown in bold.

Name Description	Example	Default
input_csanfiple Sheet (contains Cell, Plate, Read1,	"gs://fc-e0000000-0000-0000-0000-

		control statistics, one per plate. Each file contains one	
		line per cell and each line has three columns: Total	
		reads, Alignment rate and Unique rate.	
rsem_gene	Array[Array[File]]	A 2D array of RSEM gene expression estimation files.	
rsem_gene	Array[Array[File]]	A 2D array of RSEM gene expression estimation files.	
rsem_isoform	Array[Array[File]]	A 2D array of RSEM isoform expression estimation	
		files.	
rsem_trans_bam	Array[Array[File]]	A 2D array of RSEM transcriptomic BAM files.	
rsem_genome_bam	Array[Array[File]]	A 2D array of RSEM genomic BAM files if	
		output_genome_bam is true.	
rsem_time	Array[Array[File]]	A 2D array of RSEM execution time log files.	
aligner_log	Array[Array[File]]	A 2D array of Aligner log files.	
rsem_cnt	Array[Array[File]]	A 2D array of RSEM count files.	
rsem_model	Array[Array[File]]	A 2D array of RSEM model files.	
rsem_theta	Array[Array[File]]	A 2D array of RSEM generated theta files.	

This WDL generates one gene-count matrix per SMART-Seq2 plate. The gene-count matrix uses Drop-Seq format:

- The first line starts with "Gene" and then gives cell barcodes separated by tabs.
- Starting from the second line, each line describes one gene. The first item in the line is the gene name and the rest items are TPM-normalized count values of this gene for each cell.

The gene-count matrices can be fed directly into cumulus for downstream analysis.

TPM-normalized counts are calculated as follows:

- 1. Estimate the gene expression levels in TPM using *RSEM*.
- Suppose c reads are achieved for one cell, then calculate TPM-normalized count for gene i as TPM_i / 1e6
 * c.

TPM-normalized counts reflect both the relative expression levels and the cell sequencing depth.

14.6.2 Custom Genome

We also provide a way of generating user-customized Genome references for SMART-Seq2 workflow.

1. Import smartseq2_create_reference workflow to your workspace.

See the Terra documentation for adding a workflow. The smartseq2_create_reference workflow is under Broad Methods Repository with name "cumulus/smartseq2_create_reference".

Moreover, in the workflow page, click Export to Workflow... button, and select the workspace to which you want to export smartseq2_create_reference in the drop-down menu

- 2. In your workspace, open smartseq2_create_reference in WORKFLOWS tab. Select Run workflow with inputs defined by file paths as below
 - Run workflow with inputs defined by file paths
 - Run workflow(s) with inputs defined by data table

and click SAVE button.

Inputs:

Please see the description of inputs below. Note that required inputs are shown in bold.

Name	Description	Type or Example	Default
fasta	Genome fasta file		
		File. For example, "gs://fc-e0000000-0000-0000-0000- 00000000000/Homo_sapiens.GRCh38.dna.prir	nary_assembly.fa''
gtf	GTF gene annotation file (e.g. Homo_sapiens.GRCh38.83.gtf)	File. For example, "gs://fc-e0000000-0000-0000-0000- 00000000000/Homo_sapiens.GRCh38.83.gtf"	
output	_diwoglothucket url for the output folder	"gs://fc-e0000000-0000-0000-0000- 0000000000000	
	eOutput reference genome name. Output reference is a gzipped tarball with name genome_aligner.tar.gz	"GRCm38_ens97filt"	
aligner	Build indices for which aligner, choices are hisat2-hca, star, or bowtie2.	"hisat2-hca"	"hisat2- hca"
smartse	eq2_version SMART-Seq2 version to use. Versions available: 1.1.0. Versions obsoleted: 1.0.0.	"1.1.0"	"1.1.0"
docker	• "cumulusprod" for Docker Hub images; • "quay.io/cumulus" for backup images on Red Hat registry.	"quay.io/cumulus"	"cumulusprod"
zones	Google cloud zones	"us-central1-c"	"us- central1- b"
сри	Number of CPUs	Integer	If aligner is bowtie2 or hisat2-hca, 8; other-wise 32
memor	yMemory size string	String	If aligner is bowtie2 or hisat2- hca,
72		Chapter 14. Version 0.1.0 July 2	7, 2018; offi- er- wise "120G"

Outputs

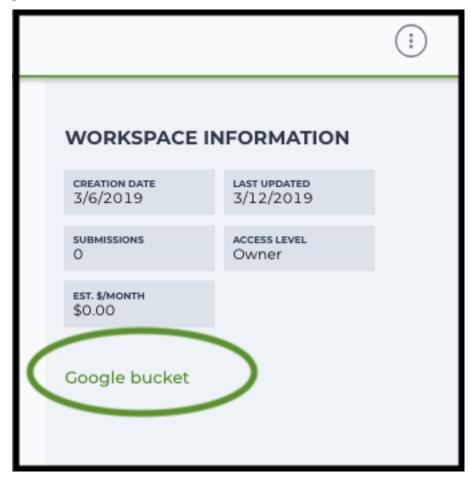

Name	Type	Description	
output_reference	File	The custom Genome reference generated. Its default file	
		name is genome_aligner.tar.gz.	
monitoring_log	File	CPU and memory profiling log.	

14.7 Drop-seq pipeline

This workflow follows the steps outlined in the Drop-seq alignment cookbook from the McCarroll lab, except the default STAR aligner flags are *—limitOutSJcollapsed 1000000 —twopassMode Basic*. Additionally the pipeline provides the option to generate count matrices using dropEst.

1. Copy your sequencing output to your workspace bucket using gsutil in your unix terminal.

You can obtain your bucket URL in the dashboard tab of your Terra workspace under the information panel.

Note: Broad users need to be on an UGER node (not a login node) in order to use the -m flag Request an UGER node:

```
reuse UGER qrsh -q interactive -l h_vmem=4g -pe smp 8 -binding linear:8 -P regevlab
```

The above command requests an interactive node with 4G memory per thread and 8 threads. Feel free to change the memory, thread, and project parameters.

Once you're connected to an UGER node, you can make gsutil available by running:

```
reuse Google-Cloud-SDK
```

Use gsutil cp [OPTION]... src_url dst_url to copy data to your workspace bucket. For example, the following command copies the directory at /foo/bar/nextseq/Data/VK18WBC6Z4 to a Google bucket:

```
gsutil -m cp -r /foo/bar/nextseq/Data/VK18WBC6Z4 gs://fc-e0000000-0000-

$\to$0000-0000-000000000000VK18WBC6Z4$
```

- -m means copy in parallel, -r means copy the directory recursively.
- 2. Non Broad Institute users that wish to run bcl2fastq must create a custom docker image.

See *bcl2fastq* instructions.

3. Create a sample sheet.

Please note that the columns in the CSV must be in the order shown below and does not contain a header line. The sample sheet provides either the FASTQ files for each sample if you've already run bcl2fastq or a list of BCL directories if you're starting from BCL directories. Please note that BCL directories must contain a valid bcl2fastq sample sheet (SampleSheet.csv):

Column	Description
Name	Sample name.
Read1	Location of the FASTQ file for read1 in the cloud (gsurl).
Read2	Location of the FASTQ file for read2 in the cloud (gsurl).

Example using FASTQ input files:

Note that in this example, sample-1 was sequenced across two flowcells.

Example using BCL input directories:

```
gs://fc-e0000000-0000-0000-0000-00000000000/flowcell-1
gs://fc-e0000000-0000-0000-0000-00000000000/flowcell-2
```

Note that the flow cell directory must contain a bcl2fastq sample sheet named SampleSheet.csv.

4. Upload your sample sheet to the workspace bucket.

Example:

5. Import *dropseq_workflow* workflow to your workspace.

See the Terra documentation for adding a workflow. The *dropseq_workflow* is under Broad Methods Repository with name "cumulus/dropseq_workflow".

Moreover, in the workflow page, click the Export to Workspace... button, and select the workspace you want to export *dropseq_workflow* workflow in the drop-down menu.

- $6. \ In \ your \ workspace, \ open \ \texttt{dropseq_workflow} \ in \ \texttt{WORKFLOWS} \ tab. \ \ \textbf{Select} \ \texttt{Run} \ \texttt{workflow} \ \texttt{with}$ inputs defined by file paths as below
 - Run workflow with inputs defined by file paths
 - Run workflow(s) with inputs defined by data table

and click the SAVE button.

14.7.1 Inputs

Please see the description of important inputs below.

Name	Description		
input_csv_file	CSV file containing sample name, read1, and read2 or a list of BCL directories.		
output_director			
	0000000000/dropseq_output")		
reference	hg19, GRCh38, mm10, hg19_mm10, mmul_8.0.1 or a path to a custom reference JSON file		
run_bcl2fastq	Whether your sample sheet contains one BCL directory per line or one sample per line (default false)		
run dropseg to	owhether to generate count matrixes using Drop-Seq tools from the McCarroll lab (default true)		
run_dropest	Whether to generate count matrixes using dropEst (default false)		
cellular_barcod	e Optional state white list of known cellular barcodes		
drop_seq_tools	_forsapptied, bypass the cell detection algorithm (the elbow method) and use this number of cells.		
dropest_cells_r	naMaximal number of output cells		
dropest_genes_	mWhinimal number of genes for cells after the merge procedure (default 100)		
dropest_min_melldreshabitofor the merge procedure (default 0.2)			
dropest_max_cb_Maxgediedittahistabeetween barcodes (default 2)			
	dropest_max_univ_amerdit_ebisitantistaetween UMIs (default 1)		
dropest_min_g	en Minimum begreaf genes for cells before the merge procedure. Used mostly for optimization.		
(default 10)			
dropest_merge_bdsecophescipremise ge strategy (can be slow), recommended to use when the list of real barcodes is			
	not available (default true)		
dropest_velocytoSave separate count matrices for exons, introns and exon/intron spanning reads (default true)			
trim_sequence	The sequence to look for at the start of reads for trimming (default "AAGCAGTGGTAT-		
	CAACGCAGAGTGAATGGG")		
trim_num_bases How many bases at the beginning of the sequence must match before trimming occur (default 5)			
umi_base_range The base location of the molecular barcode (default 13-20)			
cellular_barcode Thas basen geation of the cell barcode (default 1-12)			
star_flags	Additional options to pass to STAR aligner		

Please note that run_bcl2fastq must be set to true if you're starting from BCL files instead of FASTQs.

Custom Genome JSON

If you're reference is not one of the predefined choices, you can create a custom JSON file. Example:

The fields star_cpus and star_memory are optional and are used as the default cpus and memory for running STAR with your genome.

14.7.2 Outputs

The pipeline outputs a list of google bucket urls containing one gene-count matrix per sample. Each gene-count matrix file produced by Drop-seq tools has the suffix 'dge.txt.gz', matrices produced by dropEst have the extension .rds.

Building a Custom Genome

The tool **dropseq_bundle** can be used to build a custom genome. Please see the description of important inputs below.

Name	Description	
fasta_file	Array of fasta files. If more than one species, fasta and gtf files must be in the same order.	
gtf_file	Array of gtf files. If more than one species, fasta and gtf files must be in the same order.	
genomeSAindex Novagets (bases) of the SA pre-indexing string. Typically between 10 and 15. Longer strings wi		
	use much more memory, but allow faster searches. For small genomes, must be scaled down to	
	min(14, log2(GenomeLength)/2 - 1)	

dropseq workflow Terra Release Notes

Version 11

• Added fastq_to_sam_memory and trim_bam_memory workflow inputs

Version 10

• Updated workflow to WDL version 1.0

Version 9

• Changed input bcl2fastq docker registry from optional to required

Version 8

· Added additional parameters for bcl2fastq

Version 7

• Added support for multi-species genomes (Barnyard experiments)

Version 6

 Added star_extra_disk_space and star_disk_space_multiplier workflow inputs to adjust disk space allocated for STAR alignment task.

Version 5

 $\bullet \ \ Split\ preprocessing\ steps\ into\ separate\ tasks\ (FastqToSam,\ TagBam,\ FilterBam,\ and\ TrimBam).$

Version 4

- · Handle uncompressed fastq files as workflow input.
- Added optional prepare_fastq_disk_space_multiplier input.

Version 3

• Set default value for docker_registry input.

Version 2

• Added docker_registry input.

Version 1

- · Renamed sccloud to cumulus
- Added use_bases_mask option when running bcl2fastq

Version 18

• Created a separate docker image for running bcl2fastq

Version 17

- Fixed bug that ignored WDL input star flags (thanks to Carly Ziegler for reporting)
- Changed default value of star_flags to the empty string (Prior versions of the WDL incorrectly indicated that basic 2-pass mapping was done)

Version 16

- · Use cumulus dockerhub organization
- Changed default dropEst version to 0.8.6

Version 15

Added drop_deq_tools_prep_bam_memory and drop_deq_tools_dge_memory options

Version 14

• Fix for downloading files from user pays buckets

Version 13

• Set GCLOUD_PROJECT_ID for user pays buckets

Version 12

• Changed default dropEst memory from 52G to 104G

Version 11

• Updated formula for computing disk size for dropseq_count

Version 10

• Added option to specify merge_bam_alignment_memory and sort_bam_max_records_in_ram

Version 9

• Updated default drop_seq_tools_version from 2.2.0 to 2.3.0

Version 8

• Made additional options available for running dropEst

Version 7

Changed default dropEst memory from 104G to 52G

Version 6

• Added option to run dropEst

Version 5

• Specify full version for bcl2fastq (2.20.0.422-2 instead of 2.20.0.422)

Version 4

• Fixed issue that prevented bcl2fastq from running

Version 3

- Set default run_bcl2fastq to false
- · Create shortcuts for commonly used genomes

Version 2

• Updated QC report

Version 1

· Initial release

dropseg bundle Terra Release Notes

Version 4

• Added create_intervals_memory and extra_star_flags inputs

Version 3

- Added extra disk space inputs
- Fixed bug that prevented creating multi-genome bundles

Version 2

· Added docker_registry input

Version 1

· Renamed sccloud to cumulus

Version 1

· Changed docker organization

Version 1

· Initial release

14.8 Demultiplex genetic-pooling/cell-hashing/nucleus-hashing sc/snRNA-Seq data

This demultiplexing workflow generates gene-count matrices from cell-hashing/nucleus-hashing/genetic-pooling data by demultiplexing.

In the workflow, demuxEM is used for analyzing cell-hashing/nucleus-hashing data, while souporcell and demuxlet are for genetic-pooling data.

14.8.1 Prepare input data and import workflow

1. Run cellranger_workflow

To demultiplex, you'll need raw gene count and hashtag matrices for cell-hashing/nucleus-hashing data, or raw gene count matrices and genome BAM files for genetic-pooling data. You can generate these data by running the cellranger_workflow.

Please refer to the cellranger_workflow tutorial for details.

When finished, you should be able to find the raw gene count matrix (e.g. raw_gene_bc_matrices_h5.h5), hashtag matrix (e.g. sample_1_ADT.csv) / genome BAM file (e.g. possorted_genome_bam.bam) for each sample.

2. Import demultiplexing

Import demultiplexing workflow to your workspace.

See the Terra documentation for adding a workflow. The *demultiplexing* workflow is under Broad Methods Repository with name "cumulus/demultiplexing".

Moreover, in the workflow page, click the Export to Workspace... button, and select the workspace to which you want to export *demultiplexing* workflow in the drop-down menu.

3. Prepare a sample sheet

3.1 Sample sheet format:

Create a sample sheet, **sample_sheet_demux.csv**, which describes the metadata for each pair of RNA and hashtag data. A brief description of the sample sheet format is listed below (**required column headers are shown in bold**).

Column	Description			
OUTNAME	Output name for one pair of RNA and hashtag data. Must be unique per pair.			
RNA	Google bucket url to the raw gene count matrix generated in Step 1.			
TagFile/ADT	Google bucket url to the hashtag file generated in Step 1. The column name can be			
	either TagFile or ADT, where ADT is to be backward compatible with sample sheets			
	working with cumulus/cumulus_hashing_cite_seq workflow.			
TYPE	Assay type, which can be cell-hashing, nucleus-hashing, or			
	genetic-pooling.			
Genotype	Google bucket url to the reference genotypes in vcf.gz format. This column is not			
	required in the following cases:			
	• When TYPE is cell-hashing or nucleus-hashing;			
	• When TYPE is genetic-pooling, demultiplexing_algorithm input is			
	souporcell, and user wish to run in <i>de novo</i> mode without reference geno-			
	types, and don't need to rename cluster names by information from a known			
	genotype vcf file.			

Example:

3.2 Upload your sample sheet to the workspace bucket:

Use gsutil (you already have it if you've installed Google Cloud SDK) in your unix terminal to upload your sample sheet to workspace bucket.

Example:

14.8.2 Workflow inputs

Below are inputs for *demultiplexing* workflow. We'll first introduce global inputs, and then inputs for each of the demultiplexing tools. Notice that required inputs are in bold.

global inputs

Name	Description	Example	Default
input_samp	ple_IshueCSV file describing metadata of RNA and hashtag	"gs://fc-e0000000-	
	data pairing.	0000-0000-0000-	
		0000000000000/sample_she	et_demux.csv"
output_dire	ectary is is the output directory (gs url + path) for all results.	"gs://fc-e0000000-	
	There will be one folder per RNA-hashtag data pair un-	0000-0000-0000-	
	der this directory.	0000000000000/demux_out	put"
genome	Reference genome name. You should choose one from this genome reference list.	"GRCh38"	
demultiplex	ingdentadtiplexing algorithm to use for genetic-pooling	"souporcell"	"souporcell"
	data. Options:		
	• "souporcell": Use souporcell, a reference-		
	genotypes-free algorithm for demultiplexing		
	droplet scRNA-Seq data.		
	• "demuxlet": Use demuxlet, a canonical algorithm		
	for demultiplexing droplet scRNA-Seq data.		
min_num_g	1	100	100
	<min_num_genes> expressed genes</min_num_genes>		
docker_regi	str Docker registry to use. Notice that docker image for	"cumulusprod"	"cumuluspro
	Bustools is seperate.		
	• "cumulusprod" for Docker Hub images;		
	• "quay.io/cumulus" for backup images on Red Hat		
	registry.		
config_versi	ionVersion of config docker image to use. This docker	"0.1"	"0.1"
	is used for parsing the input sample sheet for down-		
	stream execution. Currently only one version is avail-		
	able: "0.1".		
zones	Google cloud zones to consider for execution.	"us-east1-d us-west1-a us-	"us-
		west1-b"	central1-
			a us-
			central1-
			b us-
			central1-
			c us-
			central1-f
			us-east1-b
			us-east1-c
			us-east1-d
			us-west1-a
			us-west1-b
			us-west1-
			c"
preemptible	Number of maximum preemptible tries allowed.	2	2

demuxEM inputs

Name	Description	Example	Default
demuxEM_a	ptlamonx Estan palea meter. The Dirichlet prior concentration	0.0	0.0
	parameter (alpha) on samples. An alpha value < 1.0 will		
	make the prior sparse.		
demuxEM_n	indemum El Miparameter. Only demultiplex cells/nuclei	100	100
	with at least <demuxem_min_num_umis> of UMIs.</demuxem_min_num_umis>		
demuxEM_n	nidesinguxAMiqsantagneter. Any cell/nucleus with less than	10.0	10.0
	<pre><demuxem_min_signal_hashtag> hashtags from the</demuxem_min_signal_hashtag></pre>		
	signal will be marked as unknown.		
demuxEM_ra	and the random seed used in the	0	0
	KMeans algorithm to separate empty ADT droplets		
	from others.		
demuxEM_g	endenatex. His generate a series of diagnos-	true	true
	tic plots, including the background/signal between HTO		
	counts, estimated background probabilities, HTO distri-		
	butions of cells and non-cells, etc.		
demuxEM_g	endenatex EMId opanal one ter. If generate violin plots us-	"XIST"	
	ing gender-specific genes (e.g. Xist). <de-< td=""><td></td><td></td></de-<>		
	muxEM_generate_gender_plot> is a comma-separated		
	list of gene names		
demuxEM_v	endiconnuxEM version to use. Currently only support	"0.1.4"	"0.1.4"
	"0.1.4".		
demuxEM_n	undercopoux EM parameter. Number of CPUs to request for	8	8
	demuxEM per pair.		
demuxEM_n	necheonry xEM parameter. Memory size (integer) in GB	10	10
	needed for demuxEM per pair.		
demuxEM_d	istlenanceM parameter. Disk space (integer) in GB	20	20
	needed for demuxEM per pair.		

souporcell inputs

Name	Description	Example	Default
souporcell_v	ersimporcell version to use. Available versions:	"2020.06"	"2020.06"
	"2020.06", "2020.03".		
souporcell_d	e_novo_mode	true	true
	souporcell parameter.		
	If true, run souporcell in de novo mode without		
	reference genotypes; and if a reference genotype vcf		
	file is provided in the sample sheet, use it only for		
	matching the cluster labels computed by souporcell.		
	If false, run souporcell with		
	known_genotypes option using the reference		
	genotype vcf file specified in sample sheet, and		
	souporcell_rename_donors is required in this case.		
souporcell_n	um_clusters	8	
	souporcell parameter. Number of expected clusters		
	when doing clustering.		
	This needs to be set when running souporcell.		
	This needs to be set when running souporcen.		
souporcell_re	name_donors	"CB1,CB2,CB3,CB4"	
	souporcell parameter. A comma-separated list of donor names for renaming clusters achieved by souporcell.		
	By default, the resulting donors are <i>Donor1</i> , <i>Donor2</i> ,		
souporcell_n	usso_ucpourcell parameter. Number of CPUs to request for	32	32
	souporcell per pair.		
souporcell_n	esnoutporcell parameter. Memory size (integer) in GB	120	120
	needed for souporcell per pair.		
souporcell_d	skoupareell parameter. Disk space (integer) in GB	500	500
	needed for souporcell per pair.		

demuxlet inputs

Name	Description	Example	Default
demuxlet_ve	rsitemmuxlet version to use. Currently only support "0.1b".	"0.1b"	"0.1b"
demuxlet_me	ndernauxlet parameter. Memory size (integer) in GB	10	10
	needed for demuxlet per pair.		
demuxlet_dis	k_space	2	2
	demuxlet parameter. Disk space size (integer) in GB needed for demuxlet per pair. Notice that the overall disk space for demuxlet is this disk space plus the size of provided reference genotypes file in the sample sheet.		

14.8.3 Workflow outputs

See the table below for *demultiplexing* workflow outputs.

Name	Туре	Description
output_folders	Array[String]	A list of Google Bucket URLs of the output folders.
		Each folder is associated with one RNA-hashtag pair in
		the given sample sheet.
output_zarr_files	Array[File]	A list of demultiplexed RNA count matrices in zarr for-
		mat. Each zarr file is associated with one RNA-hashtag
		pair in the given sample sheet. Please refere to sec-
		tion load demultiplexing results into Python and R for
		its structure.

In the output subfolder of each cell-hashing/nuclei-hashing RNA-hashtag data pair, you can find the following files:

Name	Description
output_name_demux.zarr.zip	Demultiplexed RNA count matrix in zarr format. Please refer to section load demultiplexing results into Python and R for its structure.
output_name.out.demuxEM.zarr.zip	road demanaposing results into Tytion and It for its structure.
	RNA expression matrix with demultiplexed sample identities in zarr format.
	To load this file into Python, you need to first install Pegasusio on your local machine. Then use import pegasusio as io; data = io.read_input("output_name.out.demuxEM.zarr.zip") in Python environment.
	It contains 2 UnimodalData objects: one with key name suffix -hashing is the hashtag count matrix, the other one with key name suffix -rna is the demultiplexed RNA count matrix.
	To load the hashtag count matrix, type hash_data =
	data.get_data(' <genome>-hashing'), where <genome> is</genome></genome>
	the genome name of the data. The count matrix is hash_data. X; cell
	barcode attributes are stored in hash_data.obs; sample names are in hash_data.var_names. Moreover, the estimated background
	probability regarding hashtags is in
	hash_data.uns['background_probs'].
	To load the RNA matrix, type rna_data =
	data.get_data(' <genome>-rna'), where <genome> is the</genome></genome>
	genome name of the data. It only contains cells which have estimated sample assignments. The count matrix is rna_data.X. Cell barcode
	attributes are stored in rna_data.obs:
	rna_data.obs['demux_type'] stores the estimated droplet types (singlet/doublet/unknown) of cells; rna_data.obs['assignment'] stores the estimated hashtag(s) that each cell belongs to. Moreover, for
	cell-hashing/nucleus-hashing data, you can find estimated sample fractions
	(sample1, sample2,, samplen, background) for each droplet in rna_data.obsm['raw_probs'].
	Ina_data:obsm[law_plobs].
output_name.ambient hashtag.hist.pr	gOptional output. A histogram plot depicting hashtag distributions of empty
	droplets and non-empty droplets.
	s@ptipngl output. A bar plot visualizing the estimated hashtag background
	probability distribution.
output_name.real_content.hist.png	Optional output. A histogram plot depicting hashtag distributions of not-
	real-cells and real-cells as defined by total number of expressed genes in
output nama rna damuy hist na	the RNA assay. Optional output. A histogram plot depicting RNA UMI distribution for sin-
output_name.rna_demux.hist.png	glets, doublets and unknown cells.
output_name.gene_name.violin.png	Optional outputs. Violin plots depicting gender-specific gene expres-
z r z	sion across samples. We can have multiple plots if a gene list
	is provided in demuxEM_generate_gender_plot field of cumulus_hashing_cite_seq inputs.
	no_naomig_onc_ocq inputs.

In the output subfolder of each genetic-pooling RNA-hashtag data pair generated by *souporcell*, you can find the following files:

Name	Description	
output_name_demux.zarr.zip	Demultiplexed RNA count matrix in zarr format. Please refer to section	
	load demultiplexing results into Python and R for its structure.	
clusters.tsv Inferred droplet type and cluster assignment for each cell barcode.		
cluster_genotypes.vcf	Inferred genotypes for each cluster.	
match_donors.log Log of matching donors step, with information of donor matching i		

In the output subfolder of each genetic-pooling RNA-hashtag data pair generated by *demuxlet*, you can find the following files:

Name	Description	
output_name_demux.zarr.zip	Demultiplexed RNA count matrix in zarr format. Please refer to section	
	load demultiplexing results into Python and R for its structure.	
output_name.best	Inferred droplet type and cluster assignment for each cell barcode.	

14.8.4 Load demultiplexing results into Python and R

To load demultiplexed RNA count matrix into Python, you need to install Python package pegasusio first. Then follow the codes below:

```
import pegasusio as io
data = io.read_input('output_name_demux.zarr.zip')
```

Once you load the data object, you can find estimated droplet types (singlet/doublet/unknown) in data. obs['demux_type']. Notices that there are cell barcodes with no sample associated, and therefore have no droplet type.

You can also find estimated sample assignments in data.obs['assignment'].

For cell-hashing/nucleus-hashing data, if one sample name can correspond to multiple feature barcodes, each feature barcode is assigned to a unique sample name, and this deduplicated sample assignment results are in data. obs['assignment.dedup'].

To load the results into R, you need to install R package reticulate in addition to Python package pegasusio. Then follow the codes below:

```
library(reticulate)
ad <- import("pegasusio", convert = FALSE)
data <- ad$read_input("output_name_demux.zarr.zip")</pre>
```

Results are in data\$obs['demux_type'], data\$obs['assignment'], and similarly as above, for cell-hashing/nucleus-hashing data, you'll find an additional field data\$obs['assignment.dedup'] for deduplicated sample assignment in the case that one sample name can correspond to multiple feature barcodes.

14.9 Run Cumulus for sc/snRNA-Seq data analysis

14.9.1 Run Cumulus analysis

Prepare Input Data

Case One: Sample Sheet

Follow the steps below to run **cumulus** on Terra.

- 1. Create a sample sheet, **count_matrix.csv**, which describes the metadata for each sample count matrix. The sample sheet should at least contain 2 columns *Sample* and *Location*. *Sample* refers to sample names and *Location* refers to the location of the channel-specific count matrix in either of

- Drop-seq format. For example, gs://fc-e0000000-0000-0000-0000-000000000000/my_dir/sample_2/sample_2.umi.dge.txt.gz.
- csv format. If it is HCA DCP csv format, we expect the expression file has the name of expression. csv. In addition, we expect that cells.csv and genes.csv files are located under the same folder as the expression.csv. For example, gs://fc-e0000000-0000-0000-0000-00000000000/my_dir/sample_3/.
- tsv or loom format.

Additionally, an optional Reference column can be used to select samples generated from a same reference (e.g. mm10). If the count matrix is in either DGE, mtx, csv, tsv, or loom format, the value in this column will be used as the reference since the count matrix file does not contain reference name information. The only exception is mtx format. If users do not provide a Reference column, we will use the basename of the folder containing the mtx file as its reference. In addition, the Reference column can be used to aggregate count matrices generated from different genome versions or gene annotations together under a unified reference. For example, if we have one matrix generated from mm9 and the other one generated from mm10, we can write mm9_10 for these two matrices in their Reference column. Pegasus will change their references to mm9_10 and use the union of gene symbols from the two matrices as the gene symbols of the aggregated matrix. For HDF5 files (e.g. 10x v2/v3), the reference name contained in the file does not need to match the value in this column. In fact, we use this column to rename references in HDF5 files. For example, if we have two HDF files, one generated from mm9 and the other generated from mm10. We can set these two files' Reference column value to mm9_10, which will rename their reference names into mm9_10 and the aggregated matrix will contain all genes from either mm9 or mm10. This renaming feature does not work if one HDF5 file contain multiple references (e.g. mm10 and GRCh38).

You are free to add any other columns and these columns will be used in selecting channels for futher analysis. In the example below, we have *Source*, which refers to the tissue of origin, *Platform*, which refers to the sequencing platform, *Donor*, which refers to the donor ID, and *Reference*, which refers to the reference genome.

Example:

If you ran **cellranger_workflow** ahead, you should already obtain a template **count_matrix.csv** file that you can modify from **generate_count_config**'s outputs.

1. Upload your sample sheet to the workspace.

Example:

```
gsutil cp /foo/bar/projects/my_count_matrix.csv gs://fc-e0000000-0000-0000-0000-0000-00000-00000/
```

2. Import cumulus workflow to your workspace.

See the Terra documentation for adding a workflow. The *cumulus* workflow is under Broad Methods Repository with name "cumulus/cumulus".

Moreover, in the workflow page, click the Export to Workspace... button, and select the workspace to which you want to export *cumulus* workflow in the drop-down menu.

- 3. In your workspace, open cumulus in WORKFLOWS tab. Select Run workflow with inputs defined by file paths as below
 - Run workflow with inputs defined by file paths
 - Run workflow(s) with inputs defined by data table

and click the SAVE button.

Case Two: Single File

Alternatively, if you only have one single count matrix for analysis, you can go without sample sheets. **Cumulus** currently supports the following formats:

- 10x genomics v2/v3 format (hdf5);
- Drop-seq dge format;
- csv (no HCA DCP format), tsv or loom formats.

Simply upload your data to the Google Bucket of your workspace, and specify its URL in input_file field of Cumulus' global inputs (see below). For hdf5 files, there is no need to specify genome names. For other formats, you can specify genome name in considered_refs field in cluster inputs; otherwise, default name '' will be used.

In this case, the **aggregate matrices** step will be skipped.

Case Three: Multiple samples without aggregation

Sometimes, you may want to run Cumulus on multiple samples simultaneously. This is different from Case one, because samples are analyzed separately without aggregation.

1. To do it, you need to first create a data table on Terra. An example TSV file is the following:

```
entity:cumulus_test_id input_h5

5k_pbmc_v3 gs://fc-e0000000-0000-0000-000000000000/5k_pbmc_v3/raw_feature_

$\to$bc_matrix.h5

1k_pbmc_v3 gs://fc-e0000000-0000-0000-000000000000/1k_pbmc_v3/raw_feature_

$\to$bc_matrix.h5
```

You are free to add more columns, but sample ids and URLs to RNA count matrix files are required. I'll use this example TSV file for the rest of steps in this case.

1. Upload your TSV file to your workspace. Open the DATA tab on your workspace. Then click the upload button on left TABLE panel, and select the TSV file above. When uploading is done, you'll see a new data table with name "cumulus_test":

- 2. Import *cumulus* workflow to your workspace as in Case one. Then open cumulus in WORKFLOW tab. Select Run workflow(s) with inputs defined by data table, and choose *cumulus_test* from the drop-down menu.
 - Run workflow with inputs defined by file paths
 - Run workflow(s) with inputs defined by data table

- 3. In the input field, specify:
- input_file: Type this.input_h5, where this refers to the data table selected, and input_h5 is the column name in this data table for RNA count matrices.
- output_name: Type this.cumulus_test_id, where cumulus_test_id is the column name in data table for sample ids.

An example is in the screen shot below:

Task name ↓	Variable	Туре	Attribute
cumulus	input_file	File	this.input_h5
cumulus	output_directory	String	*gs://tc-e000000-0000-0000-0000-00000000000/cumulus_results"
cumulus	output_name	String	this.cumulus_test_id

Then finish setting up other inputs following the description in sections below. When you are done, click SAVE, and then RUN ANALYSIS.

Cumulus steps:

Cumulus processes single cell data in the following steps:

- 1. **aggregate_matrices** (optional). When given a CSV format sample sheet, this step aggregates channel-specific count matrices into one big count matrix. Users can specify which channels they want to analyze and which sample attributes they want to import to the count matrix in this step. Otherwise, if a single count matrix file is given, skip this step.
- 2. **cluster**. This is the main analysis step. In this step, **Cumulus** performs low quality cell filtration, highly variable gene selection, batch correction, dimension reduction, diffusion map calculation, graph-based clustering and 2D visualization calculation (e.g. t-SNE/UMAP/FLE).
- 3. **de_analysis**. This step is optional. In this step, **Cumulus** can calculate potential markers for each cluster by performing a variety of differential expression (DE) analysis. The available DE tests include Welch's t test, Fisher's exact test, and Mann-Whitney U test. **Cumulus** can also calculate the area under ROC (AUROC) curve values for putative markers. If find_markers_lightgbm is on, **Cumulus** will try to identify cluster-specific markers by training a LightGBM classifier. If the samples are human or mouse immune cells, **Cumulus** can also optionally annotate putative cell types for each cluster based on known markers.
- 4. **plot**. This step is optional. In this step, **Cumulus** can generate 6 types of figures based on the **cluster** step results:
 - **composition** plots which are bar plots showing the cell compositions (from different conditions) for each cluster. This type of plots is useful to fast assess library quality and batch effects.
 - tsne, fitsne, and net_tsne: t-SNE like plots based on different algorithms, respectively. Users can specify cell attributes (e.g. cluster labels, conditions) for coloring side-by-side.
 - umap and net_umap: UMAP like plots based on different algorithms, respectively. Users can specify cell attributes (e.g. cluster labels, conditions) for coloring side-by-side.
 - fle and net_fle: FLE (Force-directed Layout Embedding) like plots based on different algorithms, respectively. Users can specify cell attributes (e.g. cluster labels, conditions) for coloring side-by-side.
 - **diffmap** plots which are 3D interactive plots showing the diffusion maps. The 3 coordinates are the first 3 PCs of all diffusion components.
 - If input is CITE-Seq data, there will be **citeseq_fitsne** plots which are FIt-SNE plots based on epitope expression.
- 5. cirro_output. This step is optional. Generate Cirrocumulus inputs for visualization using Cirrocumulus .
- 6. scp_output. This step is optional. Generate analysis result in Single Cell Portal (SCP) compatible format.

7. **organize_results**. Copy analysis results from execution environment to destination location on Google bucket. The output organization is as follows: one top-level output folder specified by output_directory in global inputs; each sample has all it output files in a distinct subfolder, with name specified by output_name in global inputs; within this subfolder, each file has a common filename prefix specified by output_name.

In the following sections, we will first introduce global inputs and then introduce the WDL inputs and outputs for each step separately. But please note that you need to set inputs from all steps simultaneously in the Terra WDL.

Note that we will make the required inputs/outputs bold and all other inputs/outputs are optional.

global inputs

Name	Description	Example	Default
input_file	Input CSV sample sheet describing metadata of each	"gs://fc-e0000000-	
	10x channel, or a single input count matrix file	0000-0000-0000-	
		0000000000000/my_count_r	matrix.csv"
output_dire	ctoryogle bucket URL of the output directory.	"gs://fc-e0000000-	
		0000-0000-0000-	
		0000000000000/my_results_	dir"
output_nam	e This is the name of subdirectory for the current sample;	"my_sample"	
	and all output files within the subdirectory will have this		
	string as the common filename prefix.		
cumulus_vei	sionmulus version to use. Versions available: 1.0.0, 0.16.0, 0.15.0, 0.13.0, 0.12.0, 0.11.0, 0.10.0.	"1.0.0"	"1.0.0"
docker_regis	rrDocker registry to use. Options:	"cumulusprod"	"cumulusprod
	 "cumulusprod" for Docker Hub images; 		
	• "quay.io/cumulus" for backup images on Red Hat		
	registry.		
zones	Google cloud zones to consider for execution.	"us-east1-d us-west1-a us-	"us-
		west1-b"	central1-
			a us-
			central1-
			b us-
			central1-
			c us-
			central1-f
			us-east1-b
			us-east1-c
			us-east1-d
			us-west1-a
			us-west1-b
			us-west1-
	N. I. CODY. G. I. I.	22	c"
num_cpu	Number of CPUs per Cumulus job	32	64
memory	Memory size string	"200G"	"200G"
disk_space	Total disk space in GB	100	100
preemptible	Number of preemptible tries	2	2

aggregate_matrices

aggregate_matrices inputs

Name	Description	Example	Default
restrictions	Select channels that satisfy all restrictions. Each restric-	"Source:bone_marrow;Platt	orm:NextSeq"
	tion takes the format of name:value,,value. Multiple		
	restrictions are separated by ';'		
attributes	Specify a comma-separated list of outputted attributes.	"Source,Platform,Donor"	
	These attributes should be column names in the		
	count_matrix.csv file		
default_refer	enlesample count matrix is in either DGE, mtx, csv, tsv	"GRCh38"	
	or loom format and there is no Reference column in the		
	csv_file, use default_reference as the reference.		
select_only_s	in glates have demultiplexed data, turning on this option	true	false
	will make cumulus only include barcodes that are pre-		
	dicted as singlets.		
minimum_nu	n One hyolfegen barcodes with at least this number of ex-	100	100
	pressed genes		

aggregate_matrices output

Name	Туре	Description
output_aggr_zarr	File	Aggregated count matrix in Zarr format

cluster

cluster inputs

Name	Description	Example	Default
focus	Focus analysis on Unimodal data with <keys>. <keys> is a comma-separated list of keys. If None, the selfselected will be the focused one. Focus key consists of two parts: reference genome name, and data type, connected with a hyphen marker "_". Reference genome name depends on the reference you used when running Cellranger workflow. See here for reference list.</keys></keys>	"GRCh38-rna"	

Table 1 – continued from previous page

NI	Table T – continued from previou		D. (- 1)
Name	Description	Example	Default
append		"SARSCoV2-rna"	
	Append Unimodal data <key> to any <keys> in focus.</keys></key>		
	Similarly as focus keys, append key also consists of		
	two parts: reference genome name, and data type,		
	connected with a hyphen marker "-".		
	See here for reference genome list.		
channel	Specify the cell barcode attribute to represent different samples.	"Donor"	
black_list	Cell barcode attributes in black list will be poped out. Format is "attr1,attr2,,attrn".	"attr1,attr2,attr3""	
min genes	bello reavil dratta omatrix is input, empty barcodes will dom-	100	100
mm_genes_	inate pre-filtration statistics. To avoid this, for raw	100	100
	data matrix, only consider barcodes with at lease		
	<pre><min_genes_before_filtration> genes for pre-filtration</min_genes_before_filtration></pre>		
	condition.		
select only	singlets have demultiplexed data, turning on this option	false	false
sereet_omy_	will make cumulus only include barcodes that are pre-	Taise	laise
	dicted as singlets		
remap_singl	<u> </u>	"Group1:CB1,CB2;Group	2 CB3.CB4.CF
	For demultiplexed data, user can remap singlet names	Croup 1.02 1,02 2,010 up	-, 020,02 .,02
	using assignment in String in this input. This string		
	assignment takes the format		
	"new_name_i:old_name_1,old_name_2;new_name_ii:old_	d name 3;".	
	For example, if we hashed 5 libraries from 3 samples:		
	sample1_lib1, sample1_lib2; sample2_lib1,		
	sample2_lib2; sample3, we can remap them to 3		
	samples using this string:		
	"sample1:sample1_lib1,sample1_lib2;		
	sample2:sample2_lib1,sample2_lib2".		
	In this way, the new singlet names will be in metadata		
	field with key assignment, while the old names are		
	kept in metadata with key assignment.orig.		
	kept in includata with key assignment. Offig.		
subset_singl	ets	"Group2,CB6,CB7"	
saoset_singi	For demultiplexed data, user can use this input to	Group2,CBo,CB7	
	choose a subset of singlets based on their names. This		
	string takes the format "name1,name2,".		
	Note that if remap_singlets is specified,		
	subsetting happens after remapping, i.e. you should use		
	the new singlet names for choosing subset.		
	the new singlet names for choosing subset.		
	tiolf_wersteltsell and gene filtration results to a spreadsheet	true	true
	n_Itepubtsfiltration results as PDF files	true	true
plot_filtration	n_Figsize size for filtration plots. <figsize> is a comma-</figsize>	6,4	
	separated list of two numbers, the width and height of		
	the figure (e.g. 6,4)		
output_h5ac		true	true
output_loon	If generate loom-formatted file	false	false
min_genes	Only keep cells with at least <min_genes> of genes</min_genes>	500	500

Table 1 – continued from previous page

Name	Description	Example	Default
max_genes	Only keep cells with less than <max_genes> of genes</max_genes>	6000	6000

Name	Description	Example	Default
	 * "harmony": Harmony algorithm (Korsunsky et al. Nature Methods 2019). * "L/S": Location/Scale adjustment algorithm (Li and Wong. The analysis of Gene Expression Data, 2003). * "scanorama": Scanorama algorithm (Hie et al. Nature Biotechnology 2019). 	"harmony"	"harmony"
batch_group		"Donor"	None
	Batch correction assumes the differences in gene expression between channels are due to batch effects. However, in many cases, we know that channels can be partitioned into several groups and each group is biologically different from others. In this case, we will only perform batch correction for channels within each group. This option defines the groups. If <expression> is None, we assume all channels are from one group. Otherwise, groups are defined according to <expression>. <expression> takes the form of either 'attr', or 'attr1+attr2++attrn', or 'attr=value11,,value1n_1;value21,,value2n_2;;v In the first form, 'attr' should be an existing sample attribute, and groups are defined by 'attr'. In the second form, 'attr1',,'attrn' are n existing sample attributes and groups are defined by the Cartesian product of these n attributes. In the last form, there will be m + 1 groups. A cell belongs to group i (i > 0) if and only if its sample attribute 'attr' has a value among valuei1,,valuein_i. A cell belongs to group 0 if it does not belong to any</expression></expression></expression>	aluem1,,valuemn_m'.	
	other groups

de_analysis outputs

Name	Туре	Description
output_de_h5ad	Array[File]	
		List of h5ad-formatted results with DE results updated (output_name.focus_key.h5ad), in which each file is associated with a focus of the input data. To load this file in Python, you need to first install PegasusIO on your local machine. Then type import pegasusio as io; data = io.read_input('output_name.focus_key.h5ad') in Python environment. After loading, data has the similar structure as *UnimodalData* object in Description of *output_zarr* in cluster outputs section. Besides, there is one additional field varm which records DE analysis results in data.varm['de_res']. You can use Pandas DataFrame to convert it into a reader-friendly structure: import pandas as pd; df = pd.DataFrame(data.varm['de_res'], index = data.var_names). Then in the resulting data frame, genes are rows, and those DE test statistics are columns. DE analysis in cumulus is performed on each cluster against cells in all the other clusters. For instance, in the data frame, column mean_logExpr:1 refers to the mean expression of genes in log-scale for cells in Cluster 1. The number after colon refers to the cluster label to which this statistic belongs.
output_de_xlsx	Array[File]	
		List of spreadsheets reporting DE results (output_name.focus_key.de.xlsx), in which each file is associated with a focus of the input data. Each cluster has two tabs: one for up-regulated genes for this cluster, one for down-regulated ones. In each tab, genes are ranked by AUROC scores. Genes which are not significant in terms of q-values in any of the DE test are not included (at false discovery rate specified in alpha field of de_analysis inputs).
output_markers_x		List of Excel spreadsheets containing detected markers (out-put_name.focus_key.markers.xlsx), in which each file is associated with a focus of the input data. Each cluster has one tab in the spreadsheet and each tab has three columns, listing markers that are strongly up-regulated, weakly up-regulated and down-regulated.
output_anno_file	Array[File]	List of cluster-based cell type annotation files (out-put_name.focus_key.anno.txt), in which each file is associated with a focus of the input data.

How cell type annotation works

In this subsection, we will describe the format of input JSON cell type marker file, the *ad hoc* cell type inference algorithm, and the format of the output putative cell type file.

JSON file

The top level of the JSON file is an object with two name/value pairs:

- title: A string to describe what this JSON file is for (e.g. "Mouse brain cell markers").
- **cell_types**: List of all cell types this JSON file defines. In this list, each cell type is described using a separate object with 2 to 3 name/value pairs:
 - name: Cell type name (e.g. "GABAergic neuron").
 - markers: List of gene-marker describing objects, each of which has 2 name/value pairs:
 - * genes: List of positive and negative gene markers (e.g. ["Rbfox3+", "Flt1-"]).
 - * weight: A real number between 0.0 and 1.0 to describe how much we trust the markers in genes.

All markers in **genes** share the weight evenly. For instance, if we have 4 markers and the weight is 0.1, each marker has a weight of 0.1 / 4 = 0.025.

The weights from all gene-marker describing objects of the same cell type should sum up to 1.0.

 subtypes: Description on cell subtypes for the cell type. It has the same structure as the top level JSON object.

See below for an example JSON snippet:

```
"title" : "Mouse brain cell markers",
  "cell_types" : [
      "name" : "Glutamatergic neuron",
      "markers" : [
          "genes": ["Rbfox3+", "Reln+", "Slc17a6+", "Slc17a7+"],
          "weight" : 1.0
        }
      "subtypes" : {
        "title" : "Glutamatergic neuron subtype markers",
          "cell_types" : [
              "name" : "Glutamatergic layer 4",
              "markers" : [
                  "genes" : ["Rorb+", "Pagr8+"],
                  "weight" : 1.0
                }
              ]
            }
          ]
     }
 ]
```

Inference Algorithm

We have already calculated the up-regulated and down-regulated genes for each cluster in the differential expression analysis step.

First, load gene markers for each cell type from the JSON file specified, and exclude marker genes, along with their associated weights, that are not expressed in the data.

Then scan each cluster to determine its putative cell types. For each cluster and putative cell type, we calculate a score between 0 and 1, which describes how likely cells from the cluster are of this cell type. The higher the score is, the more likely cells are from the cell type.

To calculate the score, each marker is initialized with a maximum impact value (which is 2). Then do case analysis as follows:

- For a positive marker:
 - If it is not up-regulated, its impact value is set to 0.
 - Otherwise, if it is up-regulated:
 - * If it additionally has a fold change in percentage of cells expressing this marker (within cluster vs. out of cluster) no less than 1.5, it has an impact value of 2 and is recorded as a **strong supporting marker**.
 - * If its fold change (fc) is less than 1.5, this marker has an impact value of 1 + (fc 1) / 0.5 and is recorded as a **weak supporting marker**.
- For a negative marker:
 - If it is up-regulated, its impact value is set to 0.
 - If it is neither up-regulated nor down-regulated, its impact value is set to 1.
 - Otherwise, if it is down-regulated:
 - * If it additionally has 1 / fc (where fc is its fold change) no less than 1.5, it has an impact value of 2 and is recorded as a **strong supporting marker**.
 - * If 1 / fc is less than 1.5, it has an impact value of 1 + (1 / fc 1) / 0.5 and is recorded as a **weak supporting marker**.

The score is calculated as the weighted sum of impact values weighted over the sum of weights multiplied by 2 from all expressed markers. If the score is larger than 0.5 and the cell type has cell subtypes, each cell subtype will also be evaluated.

Output annotation file

For each cluster, putative cell types with scores larger than minimum_report_score will be reported in descending order with respect to their scores. The report of each putative cell type contains the following fields:

- name: Cell type name.
- score: Score of cell type.
- average marker percentage: Average percentage of cells expressing marker within the cluster between all positive supporting markers.
- **strong support**: List of strong supporting markers. Each marker is represented by a tuple of its name and percentage of cells expressing it within the cluster.
- weak support: List of week supporting markers. It has the same structure as strong support.

plot

The h5ad file contains a default cell attribute Channel, which records which channel each that single cell comes from. If the input is a CSV format sample sheet, Channel attribute matches the Sample column in the sample sheet. Otherwise, it's specified in channel field of the cluster inputs.

Other cell attributes used in plot must be added via attributes field in the aggregate_matrices inputs.

plot inputs

Name	Description	Example	Default
plot_composi	ition	"louvain_labels:Donor"	None
	Takes the format of "label:attr,label:attr,,label:attr".		
	If non-empty, generate composition plot for each "label:attr" pair.		
	"label" refers to cluster labels and "attr" refers to sample conditions		
plot_fitsne		"louvain_labels,Donor"	None
•	Takes the format of "attr,attr,,attr". If non-empty, plot attr colored FIt-SNEs side by side		
plot_tsne	Talanda famana af 65 ann ann ann ann an	"louvain_labels,Channel"	None
	Takes the format of "attr,attr,,attr". If non-empty, plot attr colored t-SNEs side by side		
plot_umap		"louvain_labels,Donor"	None
	Takes the format of "attr,attr,,attr". If non-empty, plot attr colored UMAP side by side		
plot_fle		"louvain_labels,Donor"	None
	Takes the format of "attr,attr,,attr". If non-empty, plot attr colored FLE (force-directed layout embedding) side by side		
plot_net_tsne		"leiden_labels,Channel"	None
	Takes the format of "attr,attr,,attr".		
	If non-empty, plot attr colored t-SNEs side by side based on net t-SNE result.		
plot_net_uma	ıp	"leiden_labels,Donor"	None
	Takes the format of "attr,attr,,attr". If non-empty, plot attr colored UMAP side by side based on net UMAP result.		
plot_net_fle		"leiden_labels,Donor"	None
	Takes the format of "attr,attr,,attr". If non-empty, plot attr colored FLE (force-directed layout embedding) side by side based on net FLE result.		

plot outputs

Name	Туре	Description
output_pdfs	Array[File]	Outputted pdf files
output_htmls	Array[File]	Outputted html files

Generate input files for Cirrocumulus

Generate Cirrocumulus inputs for visualization using Cirrocumulus .

cirro_output inputs

Name	Description	Example	Default
generate_cirro_Withputher to generate input files for Cirrocumulus		false	false

cirro_output outputs

Name	Type		Description
output_cirro_path	Google	Bucket	Path to Cirrocumulus inputs
	URL		

Generate SCP-compatible output files

Generate analysis result in Single Cell Portal (SCP) compatible format.

scp_output inputs

Name	Description	Example	Default
generate_scp	_dWtputher to generate SCP format output or not.	false	false
output_dense	Output dense expression matrix, instead of the default	false	false
	sparse matrix format.		

scp_output outputs

Name	Туре	Description
output_scp_files	Array[File]	Outputted SCP format files.

14.9.2 Run CITE-Seg analysis

To run CITE-Seq analysis, add "citeseq" string to focus field in cluster inputs of cumulus workflow.

An embedding of epitope expressions via FIt-SNE is available at basis X_citeseq_fitsne.

To plot this epitope embedding, specify attributes to plot in plot_citeseq_fitsne field of cluster inputs.

14.9.3 Run subcluster analysis

Once we have **cumulus** outputs, we could further analyze a subset of cells by running **cumulus_subcluster**. To run **cumulus subcluster**, follow the following steps:

1. Import **cumulus subcluster** method.

See the Terra documentation for adding a workflow. The cumulus workflow is under Broad Methods Repository with name "cumulus/cumulus_subcluster".

Moreover, in the workflow page, click the Export to Workspace... button, and select the workspace to which you want to export cumulus workflow in the drop-down menu.

- 2. In your workspace, open cumulus_subcluster in WORKFLOWS tab. Select Run workflow with inputs defined by file paths as below
 - Run workflow with inputs defined by file paths
 - Run workflow(s) with inputs defined by data table

and click the SAVE button.

cumulus subcluster steps:

cumulus_subcluster processes the subset of single cells in the following steps:

- 1. **subcluster**. In this step, **cumulus_subcluster** first select the subset of cells from **cumulus** outputs according to user-provided criteria. It then performs batch correction, dimension reduction, diffusion map calculation, graph-based clustering and 2D visualization calculation (e.g. t-SNE/UMAP/FLE).
- 2. de_analysis (optional). In this step, cumulus_subcluster calculates potential markers for each cluster by performing a variety of differential expression (DE) analysis. The available DE tests include Welch's t test, Fisher's exact test, and Mann-Whitney U test. cumulus_subcluster can also calculate the area under ROC curve (AU-ROC) values for putative markers. If the samples are human or mouse immune cells, cumulus_subcluster can optionally annotate putative cell types for each cluster based on known markers.
- 3. **plot** (optional). In this step, **cumulus_subcluster** can generate the following 5 types of figures based on the **subcluster** step results:
 - **composition** plots which are bar plots showing the cell compositions (from different conditions) for each cluster. This type of plots is useful to fast assess library quality and batch effects.
 - tsne, fitsne, and net_tsne: t-SNE like plots based on different algorithms, respectively. Users can specify different cell attributes (e.g. cluster labels, conditions) for coloring side-by-side.
 - umap and net_umap: UMAP like plots based on different algorithms, respectively. Users can specify different cell attributes (e.g. cluster labels, conditions) for coloring side-by-side.

- **fle** and **net_fle**: FLE (Force-directed Layout Embedding) like plots based on different algorithms, respectively. Users can specify different cell attributes (e.g. cluster labels, conditions) for coloring side-by-side.
- **diffmap** plots which are 3D interactive plots showing the diffusion maps. The 3 coordinates are the first 3 PCs of all diffusion components.

cumulus_subcluster's inputs

cumulus_subcluster shares many inputs/outputs with **cumulus**, we will only cover inputs/outputs that are specific to **cumulus subcluster** in this section.

Note that we will make the required inputs/outputs bold and all other inputs/outputs are optional.

Name	Description	Example	Default
input_h5ad	Google bucket URL of input h5ad file containing cumu-	"gs://fc-e0000000-	
	lus results	0000-0000-0000-	
		0000000000000/my_results_	dir/my_results.h5ad
output_nam	e This is the prefix for all output files. It should contain	"gs://fc-e0000000-	
	the Google bucket URL, subdirectory name and output	0000-0000-0000-	
	name prefix	0000000000000/my_results_	dir/my_results_sub"
subset_selec	tions	"louvain_labels:3,6"	
	Specify which cells will be included in the subcluster analysis.	or "lou- vain_labels:3,6;Donor:1,2"	
	This field contains one or more <subset_selection> strings separated by ';'.</subset_selection>		
	Each <subset_selection> string takes the format of 'attr:value,,value', which means select cells with attr in the values.</subset_selection>		
	If multiple <subset_selection> strings are specified, the subset of cells selected is the intersection of these strings</subset_selection>		
calculate_pse	utatimeate diffusion-based pseudotimes based on	"sample_1-	None
	<roots>. <roots> should be a comma-separated list of</roots></roots>	ACCCGGGTTT-	
	cell barcodes	1,sample_1-	
		TCCCGGGAAA-2"	
num_cpu	Number of cpus per cumulus job	32	64
memory	Memory size string	"200G"	"200G"
disk_space	Total disk space in GB	100	100
preemptible	Number of preemptible tries	2	2

For other **cumulus_subcluster** inputs, please refer to cumulus cluster inputs list for details. Notice that some inputs (as listed below) in **cumulus cluster** inputs list are DISABLED for **cumulus_subcluster**:

- cite seq
- cite_seq_capping
- output_filtration_results
- plot_filtration_results
- plot_filtration_figsize
- output_seurat_compatible

- · batch_group_by
- min_genes
- max_genes
- min_umis
- max_umis
- mito_prefix
- percent_mito
- gene_percent_cells
- min_genes_on_raw
- counts_per_cell_after

cumulus subcluster's outputs

Name	Type	Description
output_h5ad	File	
		h5ad-formatted HDF5 file containing all results (output_name.h5ad). If perform_de_analysis is on, this file should be the same as output_de_h5ad. To load this file in Python, it's similar as in cumulus cluster outputs section. Besides, for subcluster results, there is a new cell attributes in data.obs['pseudo_time'], which records the inferred pseudotime for each cell.
output_log	File	This is a copy of the logging module output, containing important interme-
		diate messages
output_loom_file	File	Generated loom file (output_name.loom)
output_de_h5ad	File	Generated h5ad-formatted results with DE results updated (out-
		put_name.h5ad)
output_de_xlsx	File	Generated Spreadsheet reporting DE results (output_name.de.xlsx)
output_pdfs	Array[File]	Generated pdf files
output_htmls	Array[File]	Generated html files

14.9.4 Load Cumulus results into Pegasus

Pegasus is a Python package for large-scale single-cell/single-nucleus data analysis, and it uses PegasusIO for read/write. To load Cumulus results into Pegasus, we provide instructions based on file format:

• zarr: Annotated Zarr file in zip format. This is the standard output format of Cumulus. You can load it by:

```
import pegasusio as io
data = io.read_input("output_name.zarr.zip")
```

• **h5ad**: When setting "**output_h5ad**" field in *Cumulus cluster* to *true*, a list of annotated H5AD file(s) will be generated besides Zarr result. If the input data have multiple foci, Cumulus will generate one H5AD file per focus. You can load it by:

```
import pegasusio as io
adata = io.read_input("output_name.focus_key.h5ad")
```

Sometimes you may also want to specify how the result is loaded into memory. In this case, read_input has argument mode. Please see its documentation for details.

• **loom**: When setting "**output_loom**" field in *Cumulus cluster* to **true**, a list of loom format file(s) will be generated besides Zarr result. Similarly as H5AD output, Cumulus generates multiple loom files if the input data have more than one foci. To load loom file, you can optionally set its genome name in the following way as this information is not contained by loom file:

```
import pegasusio as io
data = pg.read_input("output_name.focus_key.loom", genome = "GRCh38")
```

After loading, Pegasus manipulate the data matrix in PegasusIO MultimodalData structure.

14.9.5 Load Cumulus results into Seurat

Seurat is a single-cell data analysis package written in R.

Load H5AD File into Seurat

First, you need to set "output_h5ad" field to true in cumulus cluster inputs to generate Seurat-compatible output files output_name.focus_key.h5ad, in addition to the standard result output_name.zarr.zip. If the input data have multiple foci, Cumulus will generate one H5AD file per focus.

Notice that Python, and Python package annuata with version at least 0.6.22.post1, and R package reticulate are required to load the result into Seurat.

Execute the R code below to load the h5ad result into Seurat (working with both Seurat v2 and v3):

The resulting Seurat object result has three data slots:

- raw.data records filtered raw count matrix.
- data records filtered and log-normalized expression matrix.
- scale.data records variable-gene-selected, standardized expression matrix that are ready to perform PCA.

Load Ioom File into Seurat

First, you need to set "output_loom" field to true in cumulus cluster inputs to generate a loom format output file, say output_name.focus_key.loom, in addition to the standard result output_name.zarr.zip. If the input data have multiple foci, Cumulus will generate one loom file per focus.

You also need to install *loomR* package in your R environment:

```
install.package("devtools")
devtools::install_github("mojaveazure/loomR", ref = "develop")
```

Execute the R code below to load the loom file result into Seurat (working with Seurat v3 only):

```
source("https://raw.githubusercontent.com/klarman-cell-observatory/cumulus/master/
    →workflows/cumulus/loom2seurat.R")
result <- convert_loom_to_seurat("output_name.focus_key.loom")</pre>
```

In addition, if you want to set an active cluster label field for the resulting Seurat object, do the following:

```
Idents(result) <- result@meta.data$louvain_labels
```

where <code>louvain_labels</code> is the key to the Louvain clustering result in Cumulus, which is stored in cell attributes result@meta.data.

14.9.6 Load Cumulus results into SCANPY

SCANPY is another Python package for single-cell data analysis. We provide instructions on loading Cumulus output into SCANPY based on file format:

• **h5ad**: Annotated H5AD file. This is the standard output format of Cumulus:

```
import scanpy as sc
adata = sc.read_h5ad("output_name.h5ad")
```

Sometimes you may also want to specify how the result is loaded into memory. In this case, read_h5ad has argument backed. Please see SCANPY documentation for details.

• loom: This format is generated when setting "output_loom" field in Cumulus cluster to true:

```
import scanpy as sc
adata = sc.read_loom("output_name.loom")
```

Besides, read_loom has a boolean sparse argument to decide whether to read the data matrix as sparse, with default value True. If you want to load it as a dense matrix, simply type:

```
adata = sc.read_loom("output_name.loom", sparse = False)
```

After loading, SCANPY manipulates the data matrix in anndata structure.

14.9.7 Visualize Cumulus results in Python

Ensure you have Pegasus installed.

Download your analysis result data, say output_name.zarr.zip, from Google bucket to your local machine.

Load the output:

```
import pegasusio as io
data = io.read_input("output_name.zarr.zip")
```

Violin plot of the computed quality measures:

t-SNE plot colored by louvain cluster labels and channel:

```
fig = pg.embedding(data, basis = 'tsne', keys = ['louvain_labels', 'Channel'])
fig.savefig('output_file.tsne.pdf', dpi = 500)
```

t-SNE plot colored by genes of interes (also known as Feature Plot):

```
fig = pg.embedding(data, basis = 'tsne', keys = ['CD4', 'CD8A'])
fig.savefig('output_file.genes.tsne.pdf', dpi = 500)
```

For other embedding plots using FIt-SNE (fitsne), Net t-SNE (net_tsne), CITE-Seq FIt-SNE (citeseq_fitsne), UMAP (umap), Net UMAP (net_umap), FLE (fle), or Net FLE (net_fle) coordinates, simply substitute its basis name for tsne in the code above.

Composition plot on louvain cluster labels colored by channel:

```
fig = pg.composition_plot(data, by = 'louvain_labels', condition = 'Channel')
fig.savefig('output_file.composition.pdf', dpi = 500)
```

14.10 Topic modeling

14.10.1 Prepare input data

Follow the steps below to run **topic_modeling** on Terra.

- 1. Prepare your count matrix. **Cumulus** currently supports the following formats: 'zarr', 'h5ad', 'loom', '10x', 'mtx', 'csv', 'tsv' and 'fcs' (for flow/mass cytometry data) formats
- 2. Upload your count matrix to the workspace.

Example:

3. Import *topic modeling* workflow to your workspace.

See the Terra documentation for adding a workflow. The *cumulus* workflow is under Broad Methods Repository with name "cumulus/topic_modeling".

Moreover, in the workflow page, click the Export to Workspace... button, and select the workspace to which you want to export *topic_modeling* workflow in the drop-down menu.

4. In your workspace, open topic_modeling in WORKFLOWS tab. Select Run workflow with inputs defined by file paths as below

- Run workflow with inputs defined by file paths
- Run workflow(s) with inputs defined by data table

and click the SAVE button.

14.10.2 Workflow input

Inputs for the *topic_modeling* workflow are described below. Required inputs are in bold.

Name	Description	Example	Default
input_file	Google bucket URL of the input count matrix.	"gs://fc-e0000000-	
		0000-0000-0000-	
		0000000000000/my_dataset.	h5ad"
number_of_	topics of number of topics.	[10,15,20]	
prefix_exclud	eComma separated list of features to exclude that start	"mt-,Rpl,Rps"	"mt-
	with prefix.		,Rpl,Rps"
min_percent_	ekprdustudfeatures expressed below min_percent.	2	
max_percent	dxprhsdedeatures expressed below min_percent.	98	
random_num	betarsdean number seed for reproducibility.	0	0

14.10.3 Workflow output

Name	Туре	Description
coherence_plot	File	Plot of coherence scores vs. number of topics
perplexity_plot	File	Plot of perplexity values vs. number of topics
cell_scores	Array[File]	Topic by cells (one file for each topic number)
feature_topics	Array[File]	Topic by features (one file for each topic number)
report	Array[File]	HTML visualization report (one file for each topic number)
stats	Array[File]	Computed coherence and perplexity (one file for each topic number)
model	Array[File]	Serialized LDA model (one file for each topic number)
corpus	File	Serialized corpus
dictionary	File	Serialized dictionary

14.11 Run Terra pipelines via command line

You can run Terra pipelines via the command line by installing the altocumulus package.

14.11.1 Install altocumulus for Broad users

Request an UGER node:

```
reuse UGER qrsh -q interactive -l h_vmem=4g -pe smp 8 -binding linear:8 -P regevlab
```

The above command requests an interactive shell using the regevlab project with 4G memory per thread, 8 threads. Feel free to change the memory, thread, and project parameters.

Add conda to your path:

```
reuse Anaconda3
```

Activate the alto virtual environment:

```
source activate /seq/regev_genome_portal/conda_env/cumulus
```

14.11.2 Install altocumulus for non-Broad users

1. Make sure you have conda installed. If you haven't installed conda, use the following commands to install it on Linux:

```
wget https://repo.continuum.io/miniconda/Miniconda3-latest-Linux-x86_64.sh . bash Miniconda3-latest-Linux-x86_64.sh -p /home/foo/miniconda3 mv Miniconda3-latest-Linux-x86_64.sh /home/foo/miniconda3
```

where /home/foo/miniconda3 should be replaced by your own folder holding Miniconda3.

Or use the following commdands for MacOS installation:

```
curl -0 curl -0 https://repo.anaconda.com/miniconda/Miniconda3-latest-MacOSX-x86_64.sh bash Miniconda3-latest-MacOSX-x86_64.sh -p /Users/foo/miniconda3 mv Miniconda3-latest-MacOSX-x86_64.sh /Users/foo/miniconda3 where ``/Users/foo/miniconda3`` should be replaced by your own folder holding_ 
JMiniconda3.
```

1. Create a conda environment named "alto" and install altocumulus:

```
conda create -n alto -y pip
source activate alto
pip install altocumulus
```

When the installation is done, type alto -h in terminal to see if you can see the help information.

14.11.3 Set up Google Cloud Account

Install Google Cloud SDK on your local machine.

Then type the following command in your terminal

```
gcloud auth application-default login
```

and follow the pop-up instructions to set up your Google cloud account.

14.11.4 Run Terra workflows via alto run

alto run runs a Terra method. Features:

• Uploads local files/directories in your inputs to a Google Cloud bucket updates the file paths to point to the Google Cloud bucket.

Your sample sheet can point to local file paths. In this case, alto run will take care of uploading directories smartly (e.g. only upload necessary files in BCL folders) and modifying the sample sheet to point to a Google Cloud bucket.

- Creates or uses an existing workspace.
- Uses the latest version of a method unless the method version is specified.

Options

Required options are in bold.

Name	Description
-m <method> -method <method></method></method>	Specify a Terra workflow < METHOD > to use. <pre><method> is of format Namespace/Name (e.g. cumulus/cellranger_workflow).</method></pre> A snapshot version number can optionally be specified (e.g. cumulus/cellranger_workflow/4); otherwise the latest snapshot of the method is used.
-w <workspace> -workspace <workspace></workspace></workspace>	Specify which Terra workspace < WORKSPACE > to use. < WORKSPACE > is also of format Namespace/Name (e.g. foo/bar). The workspace will be created if it does not exist.
-i <wdl_inputs> -inputs <wdl_inputs></wdl_inputs></wdl_inputs>	Specify the WDL input JSON file to use. It can be a local file, a JSON string, or a Google bucket URL directing to a remote JSON file.
-bucket-folder <folder></folder>	Store inputs to <folder> under workspace's google bucket.</folder>
-o <updated_json> -upload <updated_json></updated_json></updated_json>	Upload files/directories to Google bucket of the workspace, and generate an updated input JSON file (with local paths replaced by Google bucket URLs) to <updated_json> on local machine.</updated_json>
-no-cache	Disable Terra cache calling

Example

This example shows how to use alto run to run cellranger_workflow to extract gene-count matrices from sequencing output.

1. Prepare your sample sheet example_sample_sheet.csv as the following:

```
Sample, Reference, Flowcell, Lane, Index, Chemistry sample_1, GRCh38, /my-local-path/flowcell1, 1-2, SI-GA-A8, threeprime sample_2, GRCh38, /my-local-path/flowcell1, 3-4, SI-GA-B8, threeprime sample_3, mm10, /my-local-path/flowcell1, 5-6, SI-GA-C8, fiveprime sample_4, mm10, /my-local-path/flowcell1, 7-8, SI-GA-D8, fiveprime sample_1, GRCh38, /my-local-path/flowcell2, 1-2, SI-GA-A8, threeprime sample_2, GRCh38, /my-local-path/flowcell2, 3-4, SI-GA-B8, threeprime sample_3, mm10, /my-local-path/flowcell2, 5-6, SI-GA-C8, fiveprime sample_4, mm10, /my-local-path/flowcell2, 7-8, SI-GA-D8, fiveprime
```

where /my-local-path is the top-level directory of your BCL files on your local machine.

Note that sample_1, sample_2, sample_3, and sample_4 are sequenced on 2 flowcells.

2. Prepare your JSON input file inputs.json for cellranger_workflow:

```
{
    "cellranger_workflow.input_csv_file" : "/my-local-path/sample_sheet.csv",
    "cellranger_workflow.output_directory" : "gs://url/outputs",
    "cellranger_workflow.delete_input_bcl_directory": true
}
```

where gs://url/outputs is the folder on Google bucket of your workspace to hold output.

3. Run the following command to kick off your Terra workflow:

```
alto run -m cumulus/cellranger_workflow -i inputs.json -w myworkspace_namespace/

→myworkspace_name -o inputs_updated.json
```

where myworkspace_namespace/myworkspace_name should be replaced by your workspace namespace and name.

Upon success, alto run returns a URL pointing to the submitted Terra job for you to monitor.

If for any reason, your job failed. You could rerun it without uploading files again via the following command:

```
alto run -m cumulus/cellranger_workflow -i inputs_updated.json -w myworkspace_

→namespace/myworkspace_name
```

because inputs_updated.json is the updated version of inputs.json with all local paths being replaced by their corresponding Google bucket URLs after uploading.

14.12 Examples

14.12.1 Example of Cell-Hashing and CITE-Seq Analysis on Cloud

In this example, you'll learn how to perform Cell-Hashing and CITE-Seq analysis using cumulus on Terra.

0. Workspace and Data Preparation

After registering on Terra and creating a workspace there, you'll need the following two information:

- Terra workspace name. This is shown on your Terra workspace webpage, with format "<workspace-namespace>/<workspace-name>". Let it be ws-lab/ws-01 in this example, which means that your workspace has namespace ws-lab and name ws-01.

Then upload your BCL directories to Google bucket of your workspace using gsutil:

where option -m means copy in parallel, -r means copy the directory recursively, /my-local-path/BCL is the path to the top-level directory of your BCL files on your local machine, and data-source is the folder on Google bucket to hold the uploaded data.

1. Extract Gene-Count Matrices

First step is to extract gene-count matrices from sequencing output.

You need two original files from your dataset to start:

• Cell-Hashing Index CSV file, say its filename is cell_hashing_index.csv, of format "feature_barcode,feature_name". See an example below:

```
AATCATCACAAGAAA,CB1
GGTCACTGTTACGTA,CB2
......
```

where each line is a pair of feature barcode and feature name of a sample.

• CITE-Seq Index CSV file, say its filename is cite_seq_index.csv, of the same format as above. See an example below:

```
TTACATGCATTACGA, CD19
GCATTAGCATGCAGC, HLA-ABC
...
```

where each line is a pair of Barcode and Specificity of an Antibody.

Then upload them to your Google Bucket using gsutil. Assuming both files are in folder /Users/foo/data-source on your local machine, type the following command to upload:

Next, create a sample sheet, cellranger_sample_sheet.csv, for Cell Ranger processing. Below is an example:

14.12. Examples 117

For the details on how to prepare this sample sheet, please refer to Step 3 of Cell Ranger sample sheet instruction.

When you are done with the sample sheet, upload it to Google bucket:

Now we are ready to set up **cellranger_workflow** workflow for this phase. If your workspace doesn't have this workflow, import it to your workspace by following cellranger_workflow import instructions.

Then prepare a JSON file, cellranger_inputs. json, which is used to set up the workflow inputs:

where gs://fc-e0000000-0000-0000-0000-000000000000/my-dir is the remote directory in which the output of cellranger_workflow will be generated. For the details on the options above, please refer to Cell Ranger workflow inputs.

When you are done with the JSON file, on cellranger_workflow workflow page, upload cellranger_inputs. json by clicking upload json link as below:

Then Click SAVE button to save the inputs, and click RUN ANALYSIS button as below to start the job:

When the execution is done, all the output results will be in folder gs://fc-e0000000-0000-0000-0000-000000000000/my-dir.

You'll need 4 files for the next phases. 3 are from the output:

Besides, create a sample sheet, citeseq_antibody_control.csv, with content as the following example:

```
Antibody, Control
CD3-0034, Mouse_IgG1
CD4-0045, Mouse_IgG1
...
```

where each line is a pair of Antibody name and the Control group name to which it is assigned. You should be able to get this information from your experiment setting or the original dataset.

Copy or upload them to gs://fc-e0000000-0000-0000-0000-000000000000/my-dir.

2. Demultiplex Cell-Hashing Data

1. Prepare a sample sheet, demultiplex_sample_sheet.csv, with the following content:

where **OUTNAME** specifies the subfolder and file names of output, which is free to change, **RNA** and **TagFile** columns specify the RNA and hashing tag meta-data of samples, and **TYPE** is cell-hashing for this phase.

Then upload it to Google bucket:

- 2. If your workspace doesn't have **demultiplexing** workflow, import it to your workspace by following Step 2 of demultiplexing workflow preparation instructions.
- 3. Prepare an input JSON file, demultiplex_inputs.json with the following content to set up cumulus_hashing_cite_seq workflow inputs:

For the details on these options, please refer to demultiplexing workflow inputs.

4. On the page of cumulus_hashing_cite_seq workflow, upload demultiplex_inputs.json by clicking upload json link. Save the inputs, and click RUN ANALYSIS button to start the job.

When the execution is done, you'll get a processed file, exp_demux.zarr, stored on cloud gs://fc-e0000000-0000-0000-0000-000000000000/my-dir/exp/.

14.12. Examples 119

3. Merge RNA and ADT Matrices for CITE-Seq Data

1. Prepare a sample sheet, cite_seq_sample_sheet.csv, with the following content:

```
OUTNAME,RNA,ADT
exp_raw,gs://fc-e0000000-0000-0000-0000-0000000000/my-dir/exp/exp_demux.zarr,

-gs://fc-e0000000-0000-0000-0000-0000000000/my-dir/sample_cite_seq.csv
```

The structure of sample sheet here is the same as Phase 2. The difference is that you are now using the demultiplexed output h5sc file from Phase 2 as **RNA** here.

Then upload it to Google bucket:

2. Prepare an input JSON file, cite_seq_inputs.json, in the same directory as above, with the following content:

For the details on these options, please refer to cumulus cite seq workflow inputs.

3. On **cumulus_cite_seq** workflow page, clear all previous inputs, and then upload cite_seq_inputs.json by clicking upload json link. Save the new inputs, and click RUN ANALYSIS button to start the job.

When the execution is done, you'll get a merged raw matrices file, exp_raw.zarr, stored on cloud gs://fc-e0000000-0000-0000-0000-00000000000/my-dir/exp_raw.

4. Data Analysis

1. Prepare a sample sheet, cumulus_count_matrix.csv, with the following content:

```
Sample, Location exp,gs://fc-e0000000-0000-0000-0000-0000000000/my-dir/exp_raw/exp_raw.zarr
```

This sample sheet describes the metadata for each 10x channel (as one row in the sheet). **Sample** specifies the name for each channel, which can be renamed; **Location** specifies the file location, which is the output of Phase 3.

Then upload it to Google bucket:

Alternative, if you have only one count matrix for analysis, which is the case here, you can skip this step. See this manual for input file formats that cumulus currently supports.

2. If your workspace doesn't have **cumulus** workflow, import it to your workspace by following Step 2 and 3 of cumulus documentation.

3. Prepare a JSON file, cumulus_inputs.json with the following content to set up cumulus workflow inputs:

```
→dir/cumulus_count_matrix.csv",
       "cumulus.output_directory" : "gs://fc-e0000000-0000-0000-0000-
\rightarrow0000000000000/my-dir/results",
      "cumulus.output_name" : "exp_merged_out",
      "cumulus.num_cpu" : 8,
      "cumulus.select_only_singlets" : true,
      "cumulus.cite_seq" : true,
      "cumulus.run_louvain" : true,
      "cumulus.find_markers_lightgbm" : true,
      "cumulus.remove_ribo" : true,
      "cumulus.mwu" : true,
      "cumulus.annotate_cluster" : true,
      "cumulus.plot_fitsne" : "louvain_labels,assignment",
       "cumulus.plot_citeseq_fitsne" : "louvain_labels,assignment",
       "cumulus.plot_composition" : "louvain_labels:assignment"
```

Alternatively, if you have only one count matrix for analysis and has skipped Step 1, directly set its location in cumulus.input_file parameter above. For this example, it is:

All the rest parameters remain the same.

Notice that for some file formats, cumulus.genome is required.

A typical cumulus pipeline consists of 4 steps, which is given here. For the details of options above, please refer to cumulus inputs.

4. On the page of cumulus workflow, upload cumulus_inputs.json by clicking upload json link. Save the inputs, and click RUN ANALYSIS button to start the job.

- exp_merged_out.zarr: The aggregated count matrix data. This file doesn't exist if your cumulus. input_file parameter is not a sample sheet.
- exp_merged_out.h5ad: The processed RNA matrix data.
- exp_merged_out.filt.xlsx: The Quality-Control (QC) summary of the raw data.
- exp merged out.filt.{UMI, gene, mito}.pdf: The QC plots of the raw data.
- exp_merged_out.de.xlsx: Differential Expression analysis result.
- exp_merged_out.markers.xlsx: Result on cluster-specific markers predicted by gradient boosting machine.
- exp_merged_out.anno.txt: Cell type annotation output.
- exp_merged_out.fitsne.pdf: FIt-SNE plot.
- $\bullet \ \texttt{exp_merged_out.citeseq.fitsne.pdf:} \ \textbf{CITE-Seq} \ \textbf{Flt-SNE} \ \textbf{plot}.$

14.12. Examples 121

• exp_merged_out.louvain_labels.assignment.composition.pdf: Composition plot.

You can directly go to your Google Bucket to view or download these results.

(optional) Run Terra Workflows in Command Line

For Phase 1, 2, and 3, besides uploading sample sheets and setting-up workflow inputs on workflow pages, you can also start the workflow execution via command line using **altocumulus** tool.

First, install *altocumulus* by following altocumulus installation instruction.

1. For Phase 1 above, when you are done with creating a sample sheet cellranger_sample_sheet.csv on your local machine, in the same directory, prepare JSON file cellranger_inputs.json as below:

```
{
    "cellranger_workflow.input_csv_file" : "cellranger_sample_sheet.csv",
    ...
}
```

where all the rest parameters remain the same as in Phase 1. Import **cellranger_workflow** workflow to your workspace as usual.

Now run the following command in the same directory on your local machine:

```
alto run -m cumulus/cellranger_workflow -w ws-lab/ws-01 --bucket-folder my-dir -i_ cellranger_input.json -o cellranger_input_updated.json
```

Notice that if the execution failed, you could rerun the execution by setting cellranger_input_updated. json for -i option to use the sample sheet already uploaded to Google bucket. Similarly below.

2. For Phase 2 above, similarly, in the same directory of your demultiplex_sample_sheet.csv file, prepare JSON file demultiplex_inputs.json as below:

```
{
    "demultiplexing.input_sample_sheet" : "demultiplex_sample_sheet.csv",
    ......
}
```

where all the rest parameters remain the same as in Phase 2. Import **demultiplexing** workflow to your workspace as usual.

Run the following command in the same directory on your local machine:

```
alto run -m cumulus/demultiplexing -w ws-lab/ws-01 --bucket-folder my-dir -i_ demultiplex_inputs.json -o demultiplex_inputs_updated.json
```

3. For Phase 3 above, similarly, in the same directory of your cite_seq_sample_sheet.csv file, prepare JSON file cite_seq_inputs.json as below:

```
{
    "cumulus_cite_seq.input_sample_sheet" : "cite_seq_sample_sheet.csv",
    ... ...
}
```

where all the rest parameters remain the same as in Phase 3. Import **cumulus_cite_seq** workflow to your workspace as usual.

Run the following command in the same directory on your local machine:

```
alto run -m cumulus/cumulus_cite_seq -w ws-lab/ws-01 --bucket-folder my-dir -i_ →cite_seq_inputs.json -o cite_seq_inputs_updated.json
```

4. For Phase 4 above, similarly, in the same directory of your cumulus_count_matrix.csv file, prepare JSON file cumulus_inputs.json as below:

```
{
    "cumulus.input_file" : "cumulus_count_matrix.csv",
    ...
}
```

where all the rest parameters remain the same as in Phase 4.

Alternatively, if your input is not a sample sheet, simply set your cumulus_inputs.json as:

where all the rest parameters remain the same. Import cumulus workflow to your workspace as usual.

Run the following command in the same directory of your cumulus_inputs.json file:

```
alto run -m cumulus/cumulus -w ws-lab/ws-01 --bucket-folder my-dir/results -i_ 

→cumulus_inputs.json -o cumulus_inputs_updated.json
```

Examples using Terra to perform single-cell sequencing analysis are provided here. Please click the topics on the left panel under title "Examples" to explore.

14.13 Contributions

We welcome contributions to our repositories that make up the Cumulus ecosystem:

- pegasus
- · pegasusio
- demuxEM
- cumulus
- cumulus_feature_barcoding
- scPlot
- · altocumulus
- · cirrocumulus

In addition to the Cumulus team, we would like to sincerely thank the following contributors:

Name	Note
Kirk Gosik	Assistance with topic modeling workflow
